About this guide

Welcome to Qualys Cloud Platform! We’ll show you how to use the Qualys Asset Inventory CMDB Sync App to synchronize Qualys IT asset discovery and classification with the ServiceNow Configuration Management Database (CMDB) system.

About Qualys

Qualys, Inc. (NASDAQ: QLYS) is a pioneer and leading provider of cloud-based security and compliance solutions. The Qualys Cloud Platform and its integrated apps help businesses simplify security operations and lower the cost of compliance by delivering critical security intelligence on demand and automating the full spectrum of auditing, compliance and protection for IT systems and web applications.

Founded in 1999, Qualys has established strategic partnerships with leading managed service providers and consulting organizations including Accenture, BT, Cognizant Technology Solutions, Deutsche Telekom, Fujitsu, HCL, HP Enterprise, IBM, Infosys, NTT, Optiv, SecureWorks, Tata Communications, Verizon and Wipro. The company is also a founding member of the Cloud Security Alliance (CSA). For more information, please visit www.qualys.com

Qualys Support

Qualys is committed to providing you with the most thorough support. Through online documentation, telephone help, and direct email support, Qualys ensures that your questions will be answered in the fastest time possible. We support you 7 days a week, 24 hours a day. Access support information at www.qualys.com/support/
Welcome to Qualys Asset Inventory CMDB Sync

The Qualys Asset Inventory CMDB Sync App (Qualys App) for Configuration Management Database (CMDB) automatically synchronizes comprehensive information about your global IT resources that are continuously monitored by Qualys Asset Inventory. This leverages Qualys’ highly distributed and scalable cloud platform, and various data collection tools, including Qualys’ groundbreaking Cloud Agents, to compile and continually update a full inventory of your IT assets everywhere: on premises, in elastic clouds and mobile endpoints.

Key Features
- Asset information is automatically enriched with additional context such as lifecycle date and support stage, license category
- For assets that already exist in both, asset metadata can be synchronized
- Optionally, asset information is staged for user approval before being written to CMDB
- Support for multiple Qualys accounts/API sources
- Synchronization schedules can be configured and saved
- Preconfigured table transform maps for open ports, assets, network interfaces, software, processors and volumes
- Preconfigured reports

Pre-requisites
You must have a valid Qualys Account subscription with API Access and access to following modules:
- Qualys Subscription with Global IT Asset Inventory (Qualys to ServiceNow Sync)
- Asset Inventory CMDB Sync enabled within your Qualys subscription (Qualys to ServiceNow Sync)
- Vulnerability Management (ServiceNow to Qualys Sync)
Get Started

Here we'll help you with the initial configuration and setup needed to get started.

Quick Steps

Install the App - You’ll get the app from the ServiceNow app store.

Add API Source - Provide the API Source details and use Test Connection to know if the connection between ServiceNow and the defined source is working fine.

Create Schedules - Provide details to create a schedule. Once a schedule is successfully created, the sync between the source and CMDB gets working as per the schedule.

Update Properties - The Properties have pre-defined values, however you can always update a property to better suit your needs.

Install the App

Visit the ServiceNow Online Store.

Search for Qualys Asset Inventory CMDB Sync App, and click Contact Seller. Your Technical Account Manager (TAM) will contact you, and then ServiceNow provisions the app into an instance of your choice. The app then appears in the “Downloads” list of your instance. Click “Install” to start using the app.

In the Search field, type Asset Inventory, and then select Qualys Asset Inventory CMDB Sync App from the left pane. After you are done, new module appears in your ServiceNow instance that looks like this:
Add API Source

Once you install the Qualys App, you need to add the API source. Go to Qualys Asset Inventory CMDB Sync App > Configuration > API Sources, and click New.

Enter required details to create the source:

**Name** - Provide a name for the API source.

**POD** - Click and select the valid Qualys POD.

**Username** and **Password** - Enter valid Qualys Cloud Platform credentials with API access enabled for the account on the selected POD.

**Enable Qualys to ServiceNow Sync** and **Enable ServiceNow to Qualys Sync** - Select these options to allow uninterrupted sync between Qualys and ServiceNow.

**Active** - Select this option to tell us the source is active and assets should be synced from the active source. In case of multiple sources, you can use this option to activate or deactivate a source.

Click **Submit** to create the API source.

Then, after configuring and saving the API source, choose the record you just created from the API source list, open the record and click **Test Connection**.
Create Schedules

You need to set up at least one schedule. You may eventually want many more. Once a schedule is successfully created, the sync between the source and CMDB gets working as per the defined schedule.

Qualys to ServiceNow Scheduling

Go to Qualys Asset Inventory CMDB Sync App > Schedules and select “Qualys to ServiceNow” for Sync Direction.

Enter required details to configure the schedule:

**Name** - Provide a unique name for your schedule that helps you identify your schedule.

**Active** - Select to enable and activate the schedule you create. If you want to activate a schedule sometime later, you can disable this checkbox.

**API Source** - Select the API Source.

**Sync Direction** - Select Qualys to ServiceNow.
**Target Transform Map** - Select the custom transform map that tells us which destination table to put the assets in. Support of Configuration Item (CI) Class Selection allows you to define/customize the destination tables into which the pulled asset information should go after the assets are approved. Learn more

**Run, Starting, Repeat Interval** - Tell us the frequency of the schedule to be executed. For example, you could schedule it periodically every ten minutes.

**Auto Approve** - Select this to enable auto-approval of assets. This will save the effort of manually approving the assets to be staged on the production tables.

**Qualys to ServiceNow Sync** - Select the information we should fetch for each asset: Sync Ports Info, Sync Volumes Info, Sync Network Interfaces Info, Sync Software Info.

For initial sync from Qualys to ServiceNow, we recommend that you plan your schedules at an interval of every ten minutes.

Once you configure your selections, click Submit to create the schedule.

Note: The Meta Info fields and few other blank fields such as Last Run Timestamp, Last Fetched Host Id are populated with information only after the schedule is executed.

**ServiceNow to Qualys Scheduling**

Go to Qualys Asset Inventory CMDB Sync App > Schedules and select “ServiceNow to Qualys” for Sync Direction.

Enter required details to configure the schedule:

**Name** - Provide a unique name for your schedule that helps you identify your schedule.

**Active** - Select to enable and activate the schedule you create. If you want to activate a schedule sometime later, you can disable this option.
**API Source** - Select the API source.

**Sync Direction** - Select ServiceNow to Qualys.

**Run** - Tell us the frequency of the schedule to be executed. For example, we could configure to execute schedule only on-demand.

**Tracking Method** - Choose a tracking method when syncing from ServiceNow to Qualys. Choose IP, DNS, or NETBIOS tracking method.

**Qualys Asset Tag** or **Qualys Asset Group** (Optional) - Choose a Qualys Asset Tag or Qualys Asset Group. The “Qualys Asset Tag” or “Qualys Asset Group” box will assign that tag in Qualys Cloud Platform to any assets synced from ServiceNow. Note - The Asset Tags that belong to only NETWORK_RANGE type are populated. All other asset tags are ignored.

We also highly recommend you add filter conditions (at minimum IP Address) to assets to be synced. When you select a TABLE ensure that the table has a column with “ip_address” name, else the ServiceNow > Qualys sync may not function.

VM (Vulnerability Management) is enabled by default to be able to scan the assets you sync. We recommend that you do not disable this option. It is optional to enable PC (Policy Compliance).

Once you configure your selections, click Submit to create the schedule.

Note: The Meta Info fields and few other blank fields such as Last Run Timestamp are populated with information only after the schedule is executed.
Update Properties

The Asset Sync Properties have pre-populated values. However, you can always change the values to suit your needs. To view the existing properties or update the values, go to Qualys Asset Inventory CMDB Sync App > Configuration > Properties.

Let’s take a look at how each property functions.

**Size of Download batch** - Configure two properties using this setting:

- The maximum number of assets to be fetched in a single API request call made by the scheduler.
- The maximum number of records to be fetched and processed at one go from the queue by the download processor.

**Size of Upload batch** - Maximum number of records to be picked by the upload processor from the queue to be uploaded to Qualys.

**Max Transaction Lifetime (in minutes)** - The Qualys App has time restrictions on schedule run time. Although by default the time restriction is set to 10 minutes, you can change the time restriction to any time between 10 and 60 minutes. If you configure the schedule time to 20 minutes, the schedule is stopped after 20 minutes. In such a case, next scheduled run will resume from where the earlier run was stopped.

**API Timeout Setting (in milliseconds)** - The wait time (in milliseconds) for the response to the API request.

**How to add data in CMDB** - Choose a method to insert the data in CMDB:

- Transform Maps. Allows you to use single or multiple attributes but only single condition to define which assets to add/update to the CI records. Learn more
- Identification Engine. Allows you to use single or multiple attributes along with multiple conditions to define which assets to add/update to the CI records. Learn more
Customize Data List Columns

We display few columns in the data lists. You can customize which columns appear and change the column sequence. We’ll show you an example for adding the column “Qualys Asset Group” to data lists.

1) Click the icon in the main pane. The Personalize List Columns pop-up appears.

2) The Available list includes columns that are currently hidden. From this list, select the column you want to display. For example, double-click the column “Qualys Asset Group” and you’ll see it moved to the Selected list.

3) Enable or disable other settings like Wrap column text, double click to edit, and so on.

4) Click OK.

You’ll start seeing the Qualys Asset Group column. We display values in this column when the tag is present in the XML. If for some interfaces, the Qualys Asset Group is not available (XML does not contain it OR it’s empty), the value in the column will be empty.
Syncing

Start syncing your asset information between Qualys and ServiceNow CMDB.

In Summary

Sync Queue: This is where you’ll see all jobs involved during the flow of assets between Qualys and ServiceNow.

Approve Qualys Assets: This is where you’ll see assets that need manual approval when auto-approval is not enabled.

Failed Qualys Assets: This is where you’ll see assets that failed to get transformed.

Sync Queue

The Sync Queue lists jobs of two types: Upload and Download. The Type column indicates the direction of the flow of assets.

Download: Qualys to ServiceNow

This shows the list of jobs run from Qualys to ServiceNow assets. The status indicates whether the application was able to parse the XML response successfully. The XML that was transferred is also available here (usually attached as response.xml).

Upload: ServiceNow to Qualys

This is the list of assets to be synced from ServiceNow to Qualys Cloud Platform. Defining IP along with Asset Tag or Asset Group in Schedules will add two entries for an asset during upload: one for IP address and one for Asset Tag or Asset Group.
Approve Qualys Assets

Assets imported from Qualys to ServiceNow will appear here for approval after successful processing in Sync Queue. If processing fails for any record in Sync Queue (status = Error), none of the host assets in that XML will be visible here. You'll need to approve each asset individually or one screen at a time. You will overwrite data in your CMDB when you approve the asset.

Save time by using auto-approval

Enabling auto-approval of assets saves you effort and time because you won’t have to manually approve each asset. If you enable auto-approval, none of the assets are displayed in the Approve Qualys Assets list.

Failed Qualys Assets

All of the assets imported from Qualys to ServiceNow that fail to get transformed are listed in the Failed Qualys Assets list. The transformation from Qualys to ServiceNow could fail due to criteria not being matched. For example, if you define the method to add data as “Identification Engine” and there is no identifier in the app.
Advanced Configuration

The Advanced Configuration tells you about various pre-defined configurations and steps to customize them to your need. Transform Maps and Identification Engine are methods you can use to add data to your CMDB.

In Summary

App Scheduled Jobs - List of all scheduled jobs. Update or change the frequency of scheduled jobs as per your needs.

Transform Maps - Use transform mapping to map source and destination fields dynamically. Use predefined Transform Maps or create your own.

Identification Engine - Use this method to define the criteria using single or multiple attributes that uniquely identify the source assets and asset information before the assets get approved and are added to the CMDB system.

Configuration Item (CI) Class Selection - Use CI Class Selection to create customized tables and associate custom tables with custom Transform Maps.

Application Log - All log entries related to the important activities in Qualys App.

App Scheduled Jobs

All of the App Scheduled Jobs are listed under Advanced > App Scheduled Jobs.
We support the following App Scheduled Jobs. The function and frequency of execution of each job is described. However, you can always update or change the frequency of scheduled jobs as per your needs.

**Auto Approval Processor** - Checks the records to know which schedule does it belong to and processes it further. Only records that have auto-approval enabled are processed by the Auto Approval Processor.

**Download Processor** - Picks the records of type Download with Queued status from sync queue and parses the XML. The number of records to be picked in a batch is defined by the Size of Download batch setting in Properties section. Currently, we support three download processors that work in parallel to fasten the process.

**Fetch Qualys Asset Groups Schedule** - By default, this schedule is executed once daily. Once executed, it syncs all of the Asset Groups in Qualys Cloud Platform for use within the App. You may run this more than once a day if you generate Asset Groups in Qualys Cloud Platform frequently.

**Fetch Qualys Asset Tags Schedule** - By default, this schedule is executed once daily. Once executed, it syncs all of the Asset Tags in Qualys Cloud Platform for use within the App. You may run this more than once a day if you generate Asset Tags in Qualys Cloud Platform frequently.

**Qualys Sync Queue Cleanup Job** - Clears the Sync Queue records with 'SUCCESS' status (older than 30 days) and records with 'ERROR' status (older than 60 days) on daily schedule.

**Qualys Terminate Schedule Logs** - Maintains a log of the transactions that are terminated due to exceeding the time required to execute the transaction.

**Uploader** - Picks the records of type Upload with Queued status from Sync Queue and sends it to Qualys.
Transform Maps

A transform map is a set of field maps that determine the relationships between fields in an import set and fields in an existing ServiceNow table.

After creating a transform map, you can reuse it to map data from another import set to the same ServiceNow table. The Transform Maps module allows an administrator to define destinations for imported data on any ServiceNow table. Transform mapping can be as simple as a drag and drop operation to specify linking between source fields on an import set table and destination fields on any ServiceNow table.

Use transform mapping to map source and destination fields dynamically. You could easily use the predefined Transform Maps or create one to suit your need.

<table>

<td>Volume of the Asset</td>
</tr>
</tbody>
</table>

Learn more

Please refer to the ServiceNow documentation to learn more about transform maps.
Identification Engine

You could opt to use Identification Engine instead of Transform Maps. Similar to transform maps, the identification engine helps you to decide which assets should be added to CMDB system. You can define the criteria using single or multiple attributes that uniquely identify the source assets and asset information before the assets get approved and are added to the CMDB system.

Pre-requisites
- Identification Engine uses the “Configuration Management for Scoped Apps” plugin which must be installed before you start using it. Please refer to the ServiceNow documentation for detailed installation steps.

- Ensure that you add Qualys as Choices in the Discovery Source (column) of the Configuration Item (cmdb_ci table). Go to System Definition > Tables and search for Configuration Item table. In the table, open the Discovery Source column. Click New under Choices section and add Qualys as Label and Qualys as Value and click Submit.

Add or Update Rules (Pre-defined Table)
1) Navigate to Identification/Reconciliation > CI Identifiers.
2) Search for Computer Extended Table and open the record.
3) Let’s add a new Identifier Entry in the table. Click New.

4) Unlock the Criterion attributes to view the list of available attributes. Let us choose IP address from the Available section and click to move it to Selected section.

You could choose multiple attributes as well. In case of multiple attributes, AND condition is applicable for attributes. For example, IP Address and MAC Address.

5) Assign a priority to the attribute.

6) Select Allow null attribute to indicate if the assets with attribute value as null should be picked or not.

7) Click Submit.

**Custom Table**

If you are using a new custom table, then along with above mentioned steps, you also need to do the following:

Note: The following steps along with the script works only if you have selected Identification Engine for Add data in CMDB property. If you have opted for Transform Map, refer to the script in Transform Maps section.

**Create custom Transform Map**

1) Navigate to Qualys Asset Inventory CMDB Sync App > Transform Map and click New. Change the scope to Qualys App.

2) Provide a name for your transform map.
3) Select Source table and select Target table.

4) Click Submit and then open the newly created Transform Map.

5) Click New Field Map.

6) Ensure that you select source field and target field and click Submit.

7) Click New Transform script.

8) Choose OnBefore for When field and paste the following script:

```javascript
(function runTransformScript(source, map, log, target /*undefined onStart*/) ) {

if (source.target_table_name != "x_qual5_itam_app_computers_extended"){
    ignore = true; return;
}
var obj = new x_qual5_itam_app.ApproveAssets();
var transferDataType = gs.getProperty('x_qual5_itam_app.tranform_data_type');
try{
    if(transferDataType != "Transform map"){
        ignore = true;
        var payload = obj.generatePayload(map,source);
        var jsonUntil = new global.JSON();
        var input = jsonUntil.encode(payload);
        var output = sn_cmdb.IdentificationEngine.createOrUpdateCI('Qualys', input);
        obj.processQualysAsset(source,output);// Update Qualys Asset Table.
    }else{
        ignore = false;
    }
}catch(e){
    log.error("Error while transforming Asset("+source.qualys_asset_id+"). Error -"+e);
}
})(source, map, log, target);
```

Where `x_qual5_itam_app_computers_extended` is the name of the target table. The script ensures that if the name of the target table matches, only then the asset data is inserted in the specified target table. Else, the data is ignored. This way, you can create destination table depending on your need and insert the required data in it.

Where `x_qual5_itam_app.tranform_data_type`: the settings in properties that indicates the data transfer is through transform map or identification engine.

9) Click Submit. You can now change the scope of the app back to Global.
Configuration Item (CI) Class Selection

Define/customize the destination tables into which the pulled asset information should go after the assets are approved.

Easily create customized tables and associate custom tables with custom transform map. You can create separate transform map for each different destination table and then create a schedule for each transform map.

Let us consider an example where a company has a total of 100 assets. Among the 100 assets, 70 assets belong to Windows OS and the other 30 belong to Linux OS. The Transform Maps module enables an administrator to define destinations for imported data on any ServiceNow table. Using CI Class, you can easily achieve this.

Customize Transform Maps Using CI Class

The following steps along with the script work only if you have selected “Transform Map” for the “Add data in CMDB” property. If you have opted for Identification Engine, refer to the script in the Identification Engine section.

Step 1: Create your own custom tables
1) Go to System Definition > Tables and click New.
2) Ensure that you select Configuration Item (name=cmdb_ci) table in Extends table field.
3) Create custom columns as per your need.
4) Clear the Create Module check box.
5) Click Submit.

Step 2: Create custom Transform Map
1) Go to Qualys Asset Inventory CMDB Sync App > Transform Map, and click New. Change the scope to Qualys App.
2) Provide a name for your transform map.
3) Select Source table and select Target table.
4) Click Submit and then open the newly create Transform Map.
5) Click New Field Map.
6) Ensure that you select source field and target field and click Submit.
7) Click New Transform script.
8) Choose OnBefore for When field and paste the following script:

```java
if (source.target_table_name != "x_qual5_itam_app_computers_extended")
{
    ignore = true; return;
}
```
Where `x_qual5_itam_app_computers_extended` is the name of the target table. The script ensures that if the name of the target table matches, only then the asset data is inserted in the specified target table. Else, the data is ignored. This way, you can create destination table depending on your need and insert the required data in it.

9) Click Submit.

**Step 3: Create custom schedule**
Create a new custom schedule and ensure that you associate the customized transform map you created to Target Transform Map field.

**Step 4: Update report configuration**
You need to configure report settings to pick data from the customized destination table you creates to avoid data mismatch. To know more about customizing reports, click here.

**Application Log**
Log entries are listed under Advanced > Application Logs.

Logged activities include:
- API Response. For example, when you click Test Connection and if the account does not have access to Global IT Asset Inventory module.
- Schedule Lifecycle (Start, Run, and Finish)
- Lifecycle of Download Processor and Upload Processor (Start, Run, and Finish)
- Transform Type being used (Transform Map or Identification Engine)
- Asset Approval type (Manual or Auto Approval)
- Fetching Asset Tags and Asset Groups

Debugging and Troubleshooting

Here are scenarios that will help you debug certain common issues.

How to debug

In case of any unexpected application behavior one should check the application logs. The application log has four different levels of logging: Information, Error, Warning, Debug. The application writes log entries after important transitions. For example, Schedule run, on click of test connection to API Server ['Qualys Qualys Asset Inventory CMDB Sync App > Advanced > Application Log]

Observed Issues

Scenario: Sometimes clicking on ‘Test Connection” gives ‘error’ response to user.
Workaround: Check the error message.
- Try to repeat the ‘Test Connection’ a couple more times (if all input parameters are correct then ‘success’ message will be displayed)
- One can get the error message under ‘Schedule Logs’ for related entries in schedule record
- If no valid error is displayed (i.e. you are sure that the credentials are correct but API reported “unauthorized”), try again after some time. If error persists, contact Qualys Support

Scenario: When Download processor takes too much time to process
Workaround: Go to Properties and lower the Size of Download batch.

Scenario: Download Processor failed to process Sync Queue record(s)
Workaround: This may leave the corresponding Sync Queue entry in ‘Error’ state and the error details can be verified from ‘Processing Notes/Message’
User should manually change the status back to
- ‘Queued’, and reset the ‘Processor GUID’ if he/she wants to process that response again.
If you reprocess any response, it will not lead to duplicate data, as application checks whether the record already exists in staging tables before inserting.
- ‘Error’, if he/she does not want to process it again.

Scenario: Exception while approving the assets, when you have multiple CI Rules setup with the same priority
In this case, the asset fails to approve. The application log will display the following error:
Error while transforming asset(asset id). Error -java.lang.NullPointerException
Workaround: Ensure you do not have multiple CI rules with the same priority and have expected order defined.

**Scenario: Failed to approve asset using Identification Engine/Invalid Update**
This error is displayed when the application finds some error with Identification and Reconciliation APIs.

To verify the issue, you can navigate to Failed Qualys Assets > Open the asset record and see the **Notes** section. This section contains the detailed error response, as received from Identification and Reconciliation API.

**Scenario: Sometimes it is observed that ‘approving’ manually multiple assets gives ‘Transaction Timeout’ by ServiceNow**

Workaround:
- In such case there is no data loss observed in asset transformation
- To overcome transaction timeout error, it is recommended to use ‘Auto Approval’ in schedule

**Anticipated Issues**
- Parallel execution of two schedules for two different CI Classes may insert records in both the custom CI tables. Hence it is recommended to run each schedule independently created for each CI Class.
- It is quite frequent to have error in opening/viewing attached ‘response.xml’ from sync queue records. Those response.xmls are considered as incomplete.

List of expected failure modes
- Qualys API server is undergoing maintenance/downtime
- Qualys subscription expired
- User credentials used are incorrect
- User credentials are correct, but user has no Qualys App subscription from Qualys

**Common Questions**

**Do you currently support the Identification and Reconciliation API for CMDB CRUD actions?**

Yes, Qualys App supports Identification and Reconciliation APIs. The goal of this API is to maintain the integrity of the database, and to correctly identify CIs so that new records are created only if CI is truly new to CMDB. See [CMDB Identification and Reconciliation](#)

You can change how to add data in CMDB from default Transform Map to Identification Engine from Properties page. You also need to create CI Identifier Rule for Target table.
What are the Target tables and which tables being considered for comparison delta?
The records are primarily compared and updated/created on x_qual5_itam_app_computers_extended table which is extended from cmdb_ci_computer table. However, if user wants to use any other table, they can easily update the transform map to work with some other table of their choice.

Can user add data to ServiceNow app from different Qualys servers?
Yes, user can add asset data from different Qualys PODs. User needs to create different API Sources and Schedules as per Qualys servers.

What are Upload and Download type records in Queue?
It can be easily differentiated by Type field available in the table. For Downloading data to ServiceNow app (i.e syncing assets from Qualys to ServiceNow) Type will be Download. For Upload data to Qualys (Syncing assets from ServiceNow to Qualys servers) Type will be Upload.

Where can I find Assets which failed to transform in ServiceNow table?
You’ll find these assets in Failed Qualys Assets. Users can then approve these assets again.

Why do I view timestamps in GMT for schedules despite configuring a different timezone?
In the schedule scripts, we use ServiceNow’s new GlideDateTime().getDisplayValueInternal(); function to update the schedule last_run_timestamp. When this object is directly instantiated and used (e.g. in scoped application background script), it returns time in GMT, irrespective of the timezone configured for user under whom this script runs. That’s how it is designed.

Also, since ServiceNow does not allow scoped applications to set the timezone, the app cannot do that on behalf of the user who created the schedule. However, the time value you see on the UI is shown in the user set timezone - even if you set GMT date-time in this column. When the schedule runs next time, it fetches value in GMT, and not the one you see on UI. That may lead to confusion, and log entries show time in GMT, for this reason we recommend that the ServiceNow user sets his or her time to GMT.

The Schedules I defined pulled the data accurately till yesterday. But, today, the same schedule is unable to fetch any assets or related data.
Check your application logs. The reason the schedules are unable to fetch assets is because either your trial period or your subscription has expired. Contact your TAM to extend your subscription. Once you have an active subscription, you need to activate your API Source and the schedules will fetch the assets.
