Asset Management & Tagging API

Manage assets in your account that you want to scan for security and compliance, define asset tags and AWS connectors.

Modules supported

VM, PC, SCA, CERTVIEW, CLOUDVIEW

Authentication

Authentication to your Qualys account with valid Qualys credentials is required for making Qualys API requests to the Qualys API servers. Learn more about authentication to your Qualys account

Get API Notifications

We recommend you join our Community and subscribe to our API Notifications RSS Feeds for announcements and discussions.

https://community.qualys.com/community/developer/notifications-api

About Qualys

Qualys, Inc. (NASDAQ: QLYS) is a pioneer and leading provider of cloud-based security and compliance solutions. The Qualys Cloud Platform and its integrated Cloud Apps deliver businesses critical security intelligence continuously, enabling them to automate the full spectrum of auditing, compliance and protection for IT systems and web applications on premises, on endpoints and elastic clouds. For more information, please visit www.qualys.com

Qualys and the Qualys logo are proprietary trademarks of Qualys, Inc. All other products or names may be trademarks of their respective companies
Qualys user account

Authentication to your Qualys account with valid Qualys credentials is required for making Qualys API requests to the Qualys API servers.

The application must authenticate using Qualys account credentials (username and password) as part of the HTTP request. The credentials are transmitted using the “Basic Authentication Scheme” over HTTPS.

For information, see the “Basic Authentication Scheme” section of RFC #2617:

http://www.faqs.org/rfcs/rfc2617.html

The exact method of implementing authentication will vary according to which programming language is used.

The allowed methods, POST and/or GET, for each API request are documented with each API call in this user guide.

**Sample request - basic authentication**

curl -u "USERNAME:PASSWORD"
https://qualysapi.qualys.com/qps/rest/2.0/count/am/hostasset
URL to Qualys API server

Qualys maintains multiple Qualys CloudPlatforms. The API server URL that you should use for API requests depends on the platform where your Qualys account is located.

<table>

Making API calls

Curl samples in our API doc

We use curl in our API documentation to show an example how to form REST API calls, and it is not meant to be an actual production example of implementation.

Object types

You have core objects, which represent domain objects for specific business goals and related objects which contain related information or collections of information. Related objects are often simplified representations of core objects but are not implicitly core objects. For example, the tags collection on Asset is a simpler form of the Tag core object, but the ports collection is not.

Collections

Collections of related objects are found within a container object called a QList. These lists will have a specific name for the type of objects they contain. For example, the tags collection Asset is a TagSimpleQList and will read and write TagSimple API objects. These lists can contain a number of sub elements.

- count - (Read only) The total number of items returned in the list element
- list - (Read only) The items contained in the collection on the server
- set - A new collection of items to place in the server side object. Any existing items not in the list provided will be discarded.
- add - A new item to be added to the server side object. The item may be keyed of one ore more fields depending on the collection. In the even that that an item in the add collection collides with an existing entry, the existing entry will be updated with the fields provided. Many collections will allow you to either associate an existing item with the targeted collection, or create a new one and add it to the collection. If you provide a key field, most often id or uuid, the object will be looked up and associated. In the absence of these fields, a new object will be created (if the list allows it).
remove - Removes an element from the list by the collections key, usually id. If the item does not exist, the entry will be ignored. Additional fields beyond the item key will also be ignored.

update - Updates item(s) in the collection. This allows you to update the fields of non-core items via the objects and reference them. Items will be resolved by the collection’s key, and then additional fields applied to the found object. In the event that the supplied item does not match an existing related object, it will be ignored.

Whitespace in HTML tags

Whitespace (which includes line breaks) is not allowed in XML tags that are numbers.

<table>
<thead>
<tr>
<th>Invalid tag - This syntax will not work</th>
</tr>
</thead>
</table>
| <id>
| 34234
| </id>|

<table>
<thead>
<tr>
<th>Valid tag - This syntax will work just fine</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;id&gt;345254&lt;/id&gt;</td>
</tr>
</tbody>
</table>

Pagination

Some API actions will return a list of core objects but will limit the number returned (default is 100). You can change which objects are returned and the number of objects by specifying a preferences tag in the POST body of your request.

Preferences tag fields:

startFromOffset - The first item to return by index. The default is 1.

startFromId - The first item to return by primary key. No default value.

limitResults - The total number of items to return. The default is 100.
The allowed methods, POST and/or GET, for each API request are documented with each API call in this user guide.

### Sample pagination settings

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<ServiceRequest>
  <preferences>
    <startFromOffset>100</startFromOffset>
    <limitResults>50</limitResults>
  </preferences>
</ServiceRequest>
```

### Limit your results

Use the optional “fields” parameter for any Search or Get API request to limit the amount of information returned in the results. Simply specify the fields you want to include in the output, and all other information will be filtered out. Multiple fields are comma separated and wildcards are supported.

This get request will fetch tag ID 12345 and return the tag ID, name and creation date:

### Sample limit results

```
https://qualysapi.qualys.com/qps/rest/2.0/get/am/tag/12345?fields=id,name,created
```

This search request will return the ID of the connector and the ID of any default tags attached to the connector:

### Sample search connectors

```
https://qualysapi.qualys.com/qps/rest/2.0/search/am/awsassetdataconnector?fields=id,defaultTags.list.SimpleTag.id
```

Using wildcards, the example above could be represented as:

### Sample search connectors using wildcards
https://qualysapi.qualys.com/qps/rest/2.0/search/am/awsassetdataconnector?fields=id,defaultTags.*.*.iddSimpleTag.id
Tracking API usage by user

You can track API usage by a user without the need to provide user credentials such as the username and password.

Optional X-Powered-By header

API usage can be tracked using the X-Powered-By HTTP header which includes a unique ID generated for each subscription and a unique ID generated for each user. Once enabled, the X-Powered-By HTTP header is returned for each API request made by a user. The X-Powered-By HTTP header will be returned for both valid and invalid requests. However, it will not be returned if an invalid URL is hit or when user authentication fails.

Contact Qualys Support to get the X-Powered-By HTTP header enabled.

The X-Powered-By header is returned in the following format:

X-Powered-By: Qualys:<POD_ID>:<SUB_UUID>:<USER_UUID>

where,

- POD_ID is the shared POD or a PCP. Shared POD is USPOD1, USPOD2, etc.
- SUB_UUID is the unique ID generated for the subscription
- USER_UUID is the unique ID generated for the user. You can use the USER_UUID to track API usage per user.

Sample X-Powered-By header

X-Powered-By: Qualys:QAPOD4SJC:f972e2cc-69d6-7ebd-80e67b9a931475d8:06198167-43f3-7591-802a-1c400a0e81b1

Sample outputs

Here are sample outputs showing the X-Powered-By HTTP header.

Sample output for VM, PC

Sample output for other Qualys apps

...
Available operators

Operators supported by input parameters:

Integer - EQUALS, NOT EQUALS, GREATER, LESSER, IN

Text - CONTAINS, EQUALS, NOT EQUALS

Date - EQUALS, NOT EQUALS, GREATER, LESSER

Keyword - EQUALS, NOT EQUALS, IN

Boolean (true/false) - EQUALS, NOT EQUALS

* NOT EQUALS operator is not supported for update and delete actions. Using the NOT EQUALS operator for updating or deleting objects (such as tags, assets, host assets, AWS connectors, AWS authentication records, etc.) could result in accidental update or deletion of the objects without any warning. To prevent accidental updates/deletions, we do not support NOT EQUALS operator for updating/deleting objects.
Qualys Asset Management & Tagging API

Get Started

JSON Support

Qualys Asset Management and Tagging API supports JSON requests and responses starting with version 2.11. Samples are shown below.

<table>
<thead>
<tr>
<th>Headers used in samples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send JSON request</td>
</tr>
<tr>
<td>&quot;Content-Type: application/json&quot;</td>
</tr>
<tr>
<td>Get response in JSON</td>
</tr>
<tr>
<td>&quot;Accept: application/json&quot;</td>
</tr>
</tbody>
</table>

Sample 1 - Create a tag

API request

```
```

POST data:
```
{
  "ServiceRequest": {
    "data": {
      "Tag": {
        "name": "Parent Tag",
        "ruleType": "NAME_CONTAINS",
        "ruleText": "windows",
        "color": "#FFFFFF",
        "children": {
          "set": {
            "TagSimple": [
              { "name": "Child 1" },
              { "name": "Child 2" }
            ]
          }
        }
      }
    }
  }
}
```

JSON output

```json
{
    "ServiceResponse": {
        "data": [
            {
                "Tag": {
                    "ruleText": "windows",
                    "color": "#FFFFFF",
                    "modified": "2016-01-04T19:51:56Z",
                    "name": "Parent Tag",
                    "children": {
                        "list": [
                            {
                                "TagSimple": {
                                    "name": "Child 2",
                                    "id": 2066216
                                }
                            },
                            {
                                "TagSimple": {
                                    "name": "Child 1",
                                    "id": 2066217
                                }
                            }
                        ]
                    },
                    "created": "2016-01-04T19:51:56Z",
                    "ruleType": "NAME_CONTAINS",
                    "id": 2066215
                }
            }
        ],
        "count": 1,
        "responseCode": "SUCCESS"
    }
}
```

Sample 2 - Search tags

API request

POST data:
{
  "ServiceRequest": {
    "filters": {
      "Criteria": [
      
        { 
          "field": "parent",
          "operator": "EQUALS",
          "value": "2035617"
        },
        { 
          "field": "name",
          "operator": "CONTAINS",
          "value": "child"
        },
        { 
          "field": "id",
          "operator": "IN",
          "value": "2035619,2035618,2029815"
        },
        { 
          "field": "ruleType",
          "operator": "EQUALS",
          "value": "GROOVY"
        },
        { 
          "field": "color",
          "operator": "EQUALS",
          "value": "#EC7000"
        }
      ]
    }
  }
}

JSON output
{
}
"ServiceResponse" : {
  "data" : [ {
    "Tag" : {
      "ruleText" : "windows",
      "color" : "#FFFFFF",
      "modified" : "2016-01-04T19:51:56Z",
      "name" : "Parent Tag",
      "children" : [ {
        "list" : [ {
          "TagSimple" : {
            "name" : "Child 2",
            "id" : 2066216
          }
        }, { "TagSimple" : {
            "name" : "Child 1",
            "id" : 2066217
          }
        ]
      },
      "created" : "2016-01-04T19:51:56Z",
      "ruleType" : "NAME_CONTAINS",
      "id" : 2066215
    }
  ]
},
  "count" : 1,
  "responseCode" : "SUCCESS"
} ]
}
Know your portal version

/qps/rest/portal/version/

[GET]

Using the Version API you can find out the installed version of Portal and its sub-modules that are available in your subscription.

Sample XML

<table>
<thead>
<tr>
<th>API request</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Response</th>
</tr>
</thead>
</table>
Sample JSON

API request

curl -u "USERNAME:PASSWORD" -X "GET" -H "Accept: application/json"
https://qualysapi.qualys.com/qps/rest/portal/version

Response

{
  "ServiceResponse": {
    "data": [
      {
        "Portal-Version": {
          "WAS-VERSION": "6.0.0.0",
          "VM-VERSION": "1.0.3",
          "CM-VERSION": "1.20.1",
          "MDS-VERSION": "2.11.7.0",
          "CA-VERSION": "2.9.1.0",
          "QUESTIONNAIRE-VERSION": "2.14.0.4",
          "WAF-VERSION": "2.7.0.0"
        }]
      },
      ...
    ],
    "responseCode": "SUCCESS",
    "count": 1
  }
}
Tags

Create Tag

/qps/rest/2.0/create/am/tag

[POST]

Create a new tag and possibly child tags.

Permissions required - Managers with full scope, other users must have these permissions: Access Permission “API Access”, Tag Permission “Create User Tag”, Tag Permission “Modify Dynamic Tag Rules” (to create a dynamic tag)

Note: Provider name is mandatory in case of Cloud Asset tag.

Sample - Create new tag with 3 child tags

API request

Note: “file.xml” contains the request POST data.

Request POST data

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<ServiceRequest>
  <data>
    <Tag>
      <name>Parent Tag</name>
      <ruleType>Groovy</ruleType>
      <ruleText>if(asset.getAssetType()!=Asset.AssetType.HOST) return false;
      return asset.hasVulnsWithSeverity(4,5)</ruleText>
      <created>2014-02-06T19:14:50Z</created>
      <modified>2014-02-06T19:14:50Z</modified>
      <color>#FFFFFF</color>
    </Tag>
  </data>
</ServiceRequest>
```
<children>
  <set>
    <TagSimple>
      <name>Child 1</name>
    </TagSimple>
    <TagSimple>
      <name>Child 2</name>
    </TagSimple>
    <TagSimple>
      <name>Child 3</name>
    </TagSimple>
  </set>
  <children/>
</Tag>
</data>
</ServiceRequest>

Response

<?xml version="1.0" encoding="UTF-8"?>
<ServiceResponse xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="https://qualysapi.qualys.com/qps/xsd/2.0/am/tag.xsd">
  <responseCode>SUCCESS</responseCode>
  <count>1</count>
  <data>
    <Tag>
      <id>1589217</id>
      <name>Parent Tag</name>
      <created>2014-02-06T19:14:50Z</created>
      <modified>2014-02-06T19:14:50Z</modified>
      <color>#FFFFFF</color>
      <ruleText>
        if(asset.getAssetType()!="Asset.AssetType.HOST") return false;
        return asset.hasVulnsWithSeverity(4,5)
      </ruleText>
      <ruleType>GROOVY</ruleType>
    </Tag>
  </children>
</ServiceResponse>
Tags

XSD

<platform API server>/qps/xsd/2.0/am/tag.xsd

Get to know Groovy

Check out the following article on our Community to learn how to create asset tags using the Groovy programming language. You’ll also get several Groovy rule examples that you can start using today.

[Create Asset Tags using Groovy](#)
Update Tag

/qps/rest/2.0/update/am/tag/<id>
/qps/rest/2.0/update/am/tag

[POST]

Update fields for a tag and collections of tags.

Click here for available operators

Using the NOT EQUALS operator for updating tags could result in accidental update of unknown tags without any warning. To prevent accidental updates of unknown tags, we do not support NOT EQUALS operator for update actions.

Permissions required - Managers with full scope, other users must have these permissions: Access Permission “API Access”, Tag Permission “Create User Tag”, Tag Permission “Modify Dynamic Tag Rules” (to create a dynamic tag)

Provider name cannot be updated.

Sample - Rename parent tag, remove some child tags

**XSD**

`<platform_API_server>/qps/xsd/2.0/am/tag.xsd`
Search Tags

/qps/rest/2.0/search/am/tag

[POST]

Returns a list of tags that match the provided criteria.

Pagination - A maximum of 100 tags are returned by default. To customize this specify a “preferences” tag in the POST body of your request.

Limit your results - Use the optional “fields” parameter to limit the amount of information returned for the tag. [Learn more](#)

Permissions required - Managers with full scope, other users must have Access Permission “API Access”

Searchable Fields

  <responseCode>SUCCESS</responseCode>
  <count>2</count>
</ServiceResponse>
```

XSD

```
<platform_API_server>/qps/xsd/2.0/am/tag.xsd
```
Delete Tag

/qps/rest/2.0/delete/am/tag/<id>
/qps/rest/2.0/delete/am/tag

[POST]

Delete one or more tags.

Click here for available operators

Using the NOT EQUALS operator for deleting tags could result in accidental deletion of unknown tags without any warning. To prevent accidental deletion of unknown tags, we do not support NOT EQUALS operator for delete actions.

Permissions required - Managers with full scope, other users must have these permissions: Access Permission “API Access” and Tag Permission “Delete User Tag”

Sample - Delete tag

API request

Response

<?xml version="1.0" encoding="UTF-8"?>
<ServiceResponse xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"

<platform_API_server>/qps/xsd/2.0/am/tag.xsd
```
List Users with their tags

/qps/rest/1.0/{action}/admin/user

Get information on users along with their tags to the authorized user. Currently, we support three actions for the users: search, count, and get details of a user.

Permissions required - Managers with full scope, other users must have Access Permission “API Access”

Search users

Search for users by using different filters for user ID, username, email, tags, and module names. If no filter is specified, all users in the user’s scope are listed.

Method: POST

XSD: user.xsd

API request

curl -u "USERNAME:PASSWORD" -H "content-type: text/xml" -X "POST" --data-binary @-
"https://qualysapi.qualys.com/qps/rest/1.0/search/admin/user" < file.xml
Note: “file.xml” contains the request POST data.

Request POST data

<ServiceRequest>
  <filters>
    <Criteria field="username" operator="CONTAINS">10</Criteria>
  </filters>
</ServiceRequest>

Response

<?xml version="1.0" encoding="UTF-8"?>
Count users

Returns the total number of users in the user's scope.
Method: POST

XSD: user.xsd

API request

```
curl -u "USERNAME:PASSWORD" -H "content-type: text/xml" -X "POST"
--data-binary @-"https://qualysapi.qualys.com/qps/rest/1.0/count/admin/user" <
file.xml
Note: “file.xml” contains the request POST data.
```

Request POST data

```
<ServiceRequest>
  <filters>
    <Criteria field="username" operator="CONTAINS">10</Criteria>
  </filters>
</ServiceRequest>
```

XML output

```
<?xml version="1.0" encoding="UTF-8"?>
<ServiceResponse xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="https://qualysapi.qualys.com/qps/xsd/1.0/admin/user.xsd">
  <responseCode>SUCCESS</responseCode>
  <count>1</count>
</ServiceResponse>
```

Get user details

View details for a user in the user’s scope. You can use search action to find a user ID to use as input.

Method: GET, POST

XSD: user.xsd

API request

```
curl -u "USERNAME:PASSWORD" " -X GET -H "Content-type: text/xml"
```

XSD

<platform_API_server>/qps/xsd/2.0/am/hostasset.xsd
Create Host Asset

/qps/rest/2.0/create/am/hostasset

[POST]

Create one or more host assets using writable fields and collections. It is a good idea to attach tags that will make new assets visible to the current user if that user does not have permission to see all assets. Otherwise users will not be able to see or modify the new assets until an administrator or process attaches the appropriate tags to them.

What's next? After you've created host assets you need to activate them to make them available for scanning and reporting. Learn more on Activating Host Assets

Permissions required - Managers with full scope. Other users must have these permissions: Access Permission “API Access” and Asset Management Permission “Create Asset”

Sample - Create new host asset with tags

API request

```bash
```

Note: “file.xml” contains the request POST data.

Request POST data

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<ServiceRequest>

Qualys Asset Management & Tagging API

Host Assets

XSD

<platform_API_server>/qps/xsd/2.0/am/hostasset.xsd
Update Host Asset

/qps/rest/2.0/update/am/hostasset/<id>

/qps/rest/2.0/update/am/hostasset

[POST]

Update fields for a host asset and collections of host assets.

Using the NOT EQUALS operator for updating host assets could result in accidental update of unknown hosts assets without any warning. To prevent accidental updates of unknown host assets, we do not support NOT EQUALS operator for update actions.

Permissions required - Managers with full scope, other users must have the requested assets in their scope and these permissions: Access Permission “API Access” and Asset Management Permission “Update Asset”

Sample - Update some fields for host asset ID

API request

curl -u "USERNAME:PASSWORD" -H "Content-type: text/xml" -X "POST" --data-binary @-
"https://qualysapi.qualys.com/qps/rest/2.0/update/am/hostasset/12345" < file.xml
Note: “file.xml” contains the request POST data.

<dimenv:platform API server>/qps/xsd/2.0/am/hostasset.xsd
Search Host Assets

/qps/rest/2.0/search/am/hostasset

[POST]

Returns a list of host assets matching the provided criteria. Assets are returned when they are visible to the user (i.e. in the user’s scope).

Pagination - A maximum of 100 host assets are returned by default. To customize this specify a “preferences” tag in the POST body of your request.

Limit your results - Use the optional “fields” parameter to limit the amount of information returned for each host asset. Learn more about limiting your results

Permissions required - Managers with full scope, other users must have these permissions: Access Permission “API Access” and Asset Management Permission “Read Asset”

Count Host Assets

/qps/rest/2.0/count/am/hostasset

[POST]

Returns the number of host assets that match the provided criteria. A host asset is counted when the asset is visible to the user (i.e. it is in the user’s scope).

Permissions required - Managers with full scope. Other users must have these permissions: Access Permission “API Access” and Asset Management Permission “Read Asset”

Delete Host Asset

/qps/rest/2.0/delete/am/hostasset/<id>

/qps/rest/2.0/delete/am/hostasset

[POST]

Delete one or more host assets.

Using the NOT EQUALS operator for deleting host assets could result in accidental deletion of unknown host assets without any warning. To prevent accidental deletion of unknown host assets, we do not support NOT EQUALS operator for delete actions.

Permissions required - Managers with full scope. Other users must have these permissions: Access Permission “API Access” and Asset Management Permission “Delete Asset”

Sample - Delete host assets with the tag “To Delete”

API request

```
```

Note: “file.xml” contains the request POST data.

Request POST data

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<ServiceRequest>
   <filters>
      <Criteria field="tagName" operator="EQUALS">To Delete</Criteria>
   </filters>
</ServiceRequest>
```

</thead>
<tbody>
<tr>
<td>serviceld</td>
<td>integer</td>
</tr>
<tr>
<td>serverName</td>
<td>string (name of the service detected on the port - read only)</td>
</tr>
</tbody>
</table>

HostAssetSoftwareQList - A list of software (HostAssetSoftware) installed on the machine, keyed on the name.

<table>
<thead>
<tr>
<th>Element</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>string</td>
</tr>
<tr>
<td>version</td>
<td>string</td>
</tr>
</tbody>
</table>

HostAssetVulnQList - A list of vulnerabilities detected on the host. Only vulnerabilities flagged as found will be returned. More detailed information about each detected vulnerability can be obtained from the HostInstanceVuln resource, cross referenced by the hostInstanceVulnId field. The HostInstanceVuln can also be used to find previously detected vulnerabilities that are currently marked as not found.

Qualys Asset Management & Tagging API
 Assets

XSD

<platform_API_server>/qps/xsd/2.0/am/asset.xsd
Count Assets

/qps/rest/2.0/count/am/asset

[POST]

Returns the number of assets that match the provided criteria. A host asset is counted when the asset is visible to the user (i.e. in the user’s scope).

Permissions required - Managers with full scope. Other users must have these permissions: Access Permission “API Access” and Asset Management Permission “Read Asset”

XSD

<platform_API_server>/qps/xsd/2.0/am/assetdataconnector.xsd
Count Connectors

/qps/rest/2.0/count/am/assetdataconnector

[POST]

Returns the number of asset data connectors that match the provided criteria. Permissions required - Managers with Full Scope.

Sample - Count connectors

Count the number of asset data connectors with the tag name USA

API request

curl -u "USERNAME:PASSWORD" 
"https://qualysapi.qualys.com/qps/rest/2.0/count/am/assetdataconnector" 
"< file.xml

Request POST data (file.xml):
<?xml version="1.0" encoding="UTF-8" ?>
<ServiceRequest>
  <filters>
    <Criteria field="defaultTags.name" operator="EQUALS">USA</Criteria>
  </filters>
</ServiceRequest>

Response

<?xml version="1.0" encoding="UTF-8"?>
<ServiceResponse xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="https://qualysapi.qualys.com/qps/xsd/2.0/am/assetdataconnector.xsd">
  <responseCode>SUCCESS</responseCode>
  <count>1</count>
</ServiceResponse>

XSD
Qualys Asset Management & Tagging API
Asset Data Connector

<platform API server>/qps/xsd/2.0/am/assetdataconnector.xsd
Delete Connector

/qps/rest/2.0/delete/am/assetdataconnector
/qps/rest/2.0/delete/am/assetdataconnector/<id>

[POST]

Delete one or more asset data connectors.

Using the NOT EQUALS operator for deleting connectors could result in accidental deletion of unknown connectors without any warning. To prevent accidental deletion of unknown connectors, we do not support NOT EQUALS operator for delete actions.

Permissions required - Managers with Full Scope.

Sample 1 - Delete a single asset data connector

**API request**
curl -n -u "USERNAME:PASSWORD" "https://qualysapi.qualys.com/qps/rest/2.0/delete/am/assetdataconnector/12345"

**Response**
```xml
<?xml version="1.0" encoding="UTF-8"?>
<ServiceResponse xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="https://qualysapi.qualys.com/qps/xsd/2.0/am/assetdataconnector.xsd">
  <responseCode>SUCCESS</responseCode>
  <count>1</count>
  <data>
    <AssetDataConnector>
      <id>12345</id>
    </AssetDataConnector>
  </data>
</ServiceResponse>
```
Sample 2 - Delete several asset data connectors tagged with the To Delete tag

### API request
```
```
Request POST data (file.xml):
```
<?xml version="1.0" encoding="UTF-8" ?>
<ServiceRequest>
  <filters>
    <Criteria field="tagName" operator="EQUALS">To Delete</Criteria>
  </filters>
</ServiceRequest>
```

### XML output
```
<?xml version="1.0" encoding="UTF-8"?>
  <responseCode>SUCCESS</responseCode>
  <count>1</count>
  <data>
    <AssetDataConnector>
      <id>1972521</id>
    </AssetDataConnector>
  </data>
</ServiceResponse>
```

### XSD

<platform API server>/qps/xsd/2.0/am/assetdataconnector.xsd
Run Connector

/qps/rest/2.0/run/am/assetdataconnector

/qps/rest/2.0/run/am/assetdataconnector/<id>

[POST]

Request that one or more asset data connectors are run. The connectors may be run immediately, or queued to run when there is capacity. The response will almost always indicate that the connector is pending. Use GET calls to monitor the status of connectors.

Permissions required - Managers with Full Scope.

Sample 1 - Run a single connector

**API request**

```bash
curl -n -u "USERNAME:PASSWORD" "https://qualysapi.qualys.com/qps/rest/2.0/run/am/assetdataconnector/12345"
```

**Response**

```xml
<?xml version="1.0" encoding="UTF-8"?>
  <responseCode>SUCCESS</responseCode>
  <count>1</count>
  <hasMoreRecords>false</hasMoreRecords>
  <data>
    <AssetDataConnector>
      <id>12345</id>
      <name>DB1</name>
      <lastSync>2014-11-26T08:44:05Z</lastSync>
      <lastError />
      <connectorState>SUCCESS</connectorState>
      <type>AWS</type>
      <defaultTags>

AWS Asset Data Connector

Get AWS Connector Info

/qps/rest/2.0/get/am/awsassetdataconnector/<id>

[GET]

Returns a single AWS connector by ID.

Limit your results - Use the optional “fields” parameter to limit the amount of information returned for the AWS connector. Learn more about limiting your results

Permissions required - Managers with full scope.

Sample 1 - Fetch the asset data connector with the ID 12345

API request

curl -n -u "USERNAME:PASSWORD" "https://qualysapi.qualys.com/qps/rest/2.0/get/am/awsassetdataconnector/12345"

Response

<?xml version="1.0" encoding="UTF-8"?>
  <responseCode>SUCCESS</responseCode>
  <count>1</count>
  <hasMoreRecords>false</hasMoreRecords>
  <data>
    <AwsAssetDataConnector>
      <id>12345</id>

XSD

<platform_API_server>/qps/xsd/2.0/am/aws_asset_data_connector.xsd
Create AWS Connector

/qps/rest/2.0/create/am/awsassetdataconnector

[POST]

Creates an AWS asset data connector.

disabled (boolean) is used to disable an EC2 connector. This parameter can be set for a “create” or “update” request. When set to “true” the connector is disabled and will not run.

- If a single connector is run and it is disabled an error is returned.
- If multiple connectors are run and all are disabled an error is returned.
- If multiple connectors are run and some are disabled, only connectors that are enabled will run.

Permissions required - Managers with full scope.

Sample 1 - Create new AWS asset data connector

API request

`<platform_API_server>/qps/xsd/2.0/am/awsassetdataconnector.xsd`
Support for China Region

/qps/rest/2.0/create/am/awsassetdataconnector

[POST]

Creates an AWS asset data connector for China region.

You can easily scan EC2 instances included in the AWS China region for vulnerabilities and policy compliance using the Qualys Cloud Platform. You can create/update EC2 connectors to pull instance info from the China region, activate discovered instances for the VM, PC or SCA module, and scan them using our EC2 scan workflow.

isChinaConfigured (boolean) is used to enable the China region for an EC2 connector using the AWS Asset Data Connector API (awsassetdataconnector). This parameter can be set for a “create” or “update” request, and is valid only when AWS China option is enabled for your subscription.

When isChinaConfigured is set to “true”

- The connector is configured to pull instance info from the China region only.
- The connector can’t be configured with allRegions set to “true”.

Permissions required - Managers with full scope.

Sample - Create new AWS asset data connector for China region

**API request**

```
curl -u "USERNAME:PASSWORD" -H "Content-type: text/xml" -X "POST" --data-binary @-
"https://qualysapi.qualys.com/qps/rest/2.0/create/am/awsassetdataconnector" < file.xml
```

Note: file.xml contains request POST data

**Request POST data**

<platform API server>/qps/xsd/2.0/am/awsassetdataconnector.xsd
Support for Cross-Account Role Authentication

/qps/rest/2.0/create/am/awsassetdataconnector

[POST]

Creates an AWS asset data connector using Cross-Account Role Authentication.

Qualys supports the creation of EC2 connectors using a cross-account access role. This allows you to grant Qualys access to your AWS EC2 instances without sharing your AWS security credentials. Qualys will access your AWS EC2 instances by assuming the IAM role that you create in your AWS account.

To get started you’ll need an IAM role created using your AWS account. You can update your existing EC2 connectors to now use cross-account access roles. Note that this migration of your existing EC2 connector to cross account role is unidirectional and cannot be reverted.

You can create only one connector for each unique AWS account. It’s recommended that you merge multiple EC2 connectors into one by removing duplicate connectors before you upgrade to ARN.

Permissions required - Managers with full scope.

Sample 1 - Create a new connector

Create connector when you already have the ARN generated from your AWS account

API request

```
```

Note: "file.xml" contains the request POST data.
<?xml version="1.0" encoding="UTF-8" ?>
<ServiceRequest>
  <data>
    <AwsAssetDataConnector>
      <name>user_john</name>
      <arn>arn:aws:iam::705355653965:role/ARN_UPGRADE</arn>
      <externalId>1234567890</externalId>
      <endpoints>
        <add>

## XSD

<platform_API_server>/qps/xsd/2.0/am/awsassetdataconnector.xsd
Run AWS Connector

/qps/rest/2.0/run/am/assetdataconnector
/qps/rest/2.0/run/am/assetdataconnector/<id>

[POST]

Request that one or more asset data connectors are run. The connectors may be run immediately, or queued to run when there is capacity. The response will almost always indicate that the connector is pending. Use GET calls to monitor the status of connectors.

Permissions required - Managers with full scope.

See Run Connector
### AWS Connector Fields

<table>
<thead>
<tr>
<th>Field name</th>
<th>Description</th>
<th>Writable</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>(long) Primary key, not writeable</td>
<td>No</td>
</tr>

<td>The AWS account ID an AWS asset data connector is connecting to.</td>
<td>No</td>
</tr>
<tr>
<td>useForCloudView</td>
<td>(boolean) If true the connector is made available in the CloudView App.</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Associations

AwsEndpointSimpleQList - A basic wrapper with one field: regionCode. This is the AWS region code, e.g. us-east-1.

AwsAuthRecordSimple - The authentication record a connector will use to communicate with AWS. id (long) is the connector ID, and name (string) is a human readable name to identify the connector key.
AWS Authentication Record

Get AWS Auth Record Info

/qps/rest/2.0/get/am/awsauthrecord/<id>

[GET]

Returns a single AWS authentication record by ID.

Limit your results - Use the optional “fields” parameter to limit the amount of information returned for the authentication record. Learn more about limiting your results

Permissions required - Managers with full scope.

Sample - Fetch details on AWS authentication record

Delete one or more Azure connectors.

Using the NOT EQUALS operator for deleting Azure connectors could result in accidental deletion of Azure connectors without any warning. To prevent accidental deletion of unknown Azure connectors, we do not support NOT EQUALS operator for delete actions.

Permissions required - Managers with full scope.

Sample 1 - Delete Azure connector

API request

curl -n -u "USERNAME:PASSWORD" "https://qualysapi.qualys.com/qps/rest/2.0/delete/am/azureassetdataconnector/289201"

Response

<?xml version="1.0" encoding="UTF-8"?>
    <responseCode>SUCCESS</responseCode>
    <count>1</count>
    <data>
        <AzureAssetDataConnector>
            <id>289201</id>
        </AzureAssetDataConnector>
    </data>
</ServiceResponse>
