Preface

Using the Qualys Asset Management and Tagging API, third parties can integrate the Qualys Security and Compliance solution into their own applications using an extensible XML interface. This user guide is intended for application developers who will use the Qualys Asset Management and Tagging API.

About Qualys

Qualys, Inc. (NASDAQ: QLYS) is a pioneer and leading provider of cloud-based security and compliance solutions with over 9,300 customers in more than 100 countries, including a majority of each of the Forbes Global 100 and Fortune 100. The Qualys Cloud Platform and integrated suite of solutions help organizations simplify security operations and lower the cost of compliance by delivering critical security intelligence on demand and automating the full spectrum of auditing, compliance and protection for IT systems and web applications. Founded in 1999, Qualys has established strategic partnerships with leading managed service providers and consulting organizations including Accenture, BT, Cognizant Technology Solutions, Fujitsu, HCL Comnet, HPE, Infosys, NTT, Optiv, SecureWorks, Tata Communications, Verizon and Wipro. The company is also a founding member of the Cloud Security Alliance (CSA). For more information, please visit www.qualys.com.

Contact Qualys Support

Qualys is committed to providing you with the most thorough support. Through online documentation, telephone help, and direct email support, Qualys ensures that your questions will be answered in the fastest time possible. We support you 7 days a week, 24 hours a day. Access support information at www.qualys.com/support/.
Welcome

Welcome to Qualys Asset Management and Tagging API. The sections that follow describe how to use the Tags API, Host Asset API, Asset API and the Host Instance Vulnerability API.

Get Started

Introduction to the API Framework - We recommend you review important information about the API framework.

URL to the Qualys API Server - We’ll give you the basics about making API requests. The base URL depends on the platform where your Qualys account is located.

Authentication - We’ll tell you about the method used for authentication. API requests must authenticate using Qualys credentials.

Usage - Check out the basics about making requests and receiving data from our asset management application.

Get API Notifications

We recommend you join our Community and subscribe to our API notifications so you’ll get email notifications telling you about important upcoming API enhancements and changes.

Introduction to the API Framework

The Qualys Asset Management and Tagging API framework offers numerous innovations and new functionality compared to the other Qualys API frameworks.

Request URL

The URL for making Asset Management and Tagging API requests respects the following structure:

https://<baseurl>/qps/rest/2.0/<operation>/<module>/<object>/<object_id>

where the components are described below.

<baseurl> The Qualys API server URL that you should use for API requests depends on the platform where your account is located. The base URL for Qualys US Platform 1 is: https://qualysapi.qualys.com

<operation> The request operation, such as get a list, get a count, search, create, and update.

,module> The API module. For the Asset Management and Tagging API, the module is: “am”.

<object> The module specific object.

<object_id> (Optional) The module specific object ID, if appropriate.

URL to the Qualys API Server

Qualys maintains multiple Qualys platforms. The Qualys API server URL that you should use for API requests depends on the platform where your account is located.

<table>
<thead>
<tr>
<th>Account Location</th>
<th>API Server URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Qualys US Platform 1</td>
<td><a href="https://qualysapi.qualys.com">https://qualysapi.qualys.com</a></td>
</tr>
<tr>
<td>Qualys US Platform 2</td>
<td><a href="https://qualysapi.qg2.apps.qualys.com">https://qualysapi.qg2.apps.qualys.com</a></td>
</tr>
<tr>
<td>Qualys US Platform 3</td>
<td><a href="https://qualysapi.qg3.apps.qualys.com">https://qualysapi.qg3.apps.qualys.com</a></td>
</tr>
<tr>
<td>Qualys EU Platform 1</td>
<td><a href="https://qualysapi.qualys.eu">https://qualysapi.qualys.eu</a></td>
</tr>
<tr>
<td>Qualys EU Platform 2</td>
<td><a href="https://qualysapi.qg2.apps.qualys.eu">https://qualysapi.qg2.apps.qualys.eu</a></td>
</tr>
<tr>
<td>Qualys India Platform 1</td>
<td><a href="https://qualysapi.qg1.apps.qualys.in">https://qualysapi.qg1.apps.qualys.in</a></td>
</tr>
<tr>
<td>Qualys Private Cloud Platform</td>
<td><a href="https://qualysapi">https://qualysapi</a>.&lt;customer_base_url&gt;</td>
</tr>
</tbody>
</table>
The Qualys API documentation and sample code use the API server URL for the Qualys US Platform 1. If your account is located on another platform, please replace this URL with the appropriate server URL for your account.

**Still have questions?** You can easily find the API server URL for your account. Just log in to your Qualys account and go to Help > About. You’ll see this information under Security Operations Center (SOC).
## Authentication

The application must authenticate using Qualys account credentials (user name and password) as part of the HTTP request. The credentials are transmitted using the “Basic Authentication Scheme” over HTTPS.

For more information, see the “Basic Authentication Scheme” section of RFC #2617:

http://www.faqs.org/rfcs/rfc2617.html

The exact method of implementing authentication will vary according to which programming language is used.

The allowed methods, POST and/or GET, for each API request are documented with each API call in this user guide.

### Example

Basic authentication - recommended option:

```bash
curl -u "USERNAME:PASSWORD"
https://qualysapi.qualys.com/qps/rest/2.0/count/am/hostasset
```

where portal.qualys.com is the base URL to the Qualys API server where your account is located.

## JSON Support

Qualys Asset Management and Tagging API supports JSON requests and responses.

Usage

Object types

You have core objects, which represent domain objects for specific business goals and related objects which contain related information or collections of information. Related objects are often simplified representations of core objects but are not implicitly core objects. For example, the tags collection on Asset is a simpler form of the Tag core object, but the ports collection is not.

Collections

Collections of related objects are found within a container object called a QList. These lists will have a specific name for the type of objects they contain. For example, the tags collection Asset is a TagSimpleQList and will read and write TagSimple API objects. These lists can contain a number of sub elements.

<table>
<thead>
<tr>
<th>Element</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>(Read only) The total number of items returned in the list element</td>
</tr>
<tr>
<td>list</td>
<td>(Read only) The items contained in the collection on the server</td>
</tr>
<tr>
<td>set</td>
<td>A new collection of items to place in the server side object. Any existing items not in the list provided will be discarded.</td>
</tr>
<tr>
<td>add</td>
<td>A new item to be added to the server side object. The item may be keyed of one ore more fields depending on the collection. In the even that that an item in the add collection collides with an existing entry, the existing entry will be updated with the fields provided. Many collections will allow you to either associate an existing item with the targeted collection, or create a new one and add it to the collection. If you provide a key field, most often id or uuid, the object will be looked up and associated. In the absence of these fields, a new object will be created (if the list allows it).</td>
</tr>
<tr>
<td>remove</td>
<td>Removes an element from the list by the collections key, usually id. If the item does not exist, the entry will be ignored. Additional fields beyond the item key will also be ignored.</td>
</tr>
<tr>
<td>update</td>
<td>Updates item(s) in the collection. This allows you to update the fields of non-core items via the objects and reference them. Items will be resolved by the collection’s key, and then additional fields applied to the found object. In the event that the supplied item does not match an existing related object, it will be ignored.</td>
</tr>
</tbody>
</table>
Whitespace in XML tags

Whitespace (which includes line breaks) is not allowed in XML tags that are numbers.

<table>
<thead>
<tr>
<th>Invalid tag</th>
<th>Valid tag</th>
</tr>
</thead>
<tbody>
<tr>
<td>This syntax will not work:</td>
<td>This syntax will work just fine:</td>
</tr>
<tr>
<td><code>&lt;id&gt;</code> 34234</td>
<td><code>&lt;id&gt;</code> 345254</td>
</tr>
</tbody>
</table>

Pagination

Some API actions will return a list of core objects but will limit the number returned (default is 100). You can change which objects are returned and the number of objects by specifying a preferences tag in the POST body of your request.

Preferences tag fields

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startFromOffset</td>
<td>The first item to return by index. The default is 1.</td>
</tr>
<tr>
<td>startFromId</td>
<td>The first item to return by primary key. No default value.</td>
</tr>
<tr>
<td>limitResults</td>
<td>The total number of items to return. The default is 100.</td>
</tr>
</tbody>
</table>

Example

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<ServiceRequest>
    <preferences>
        <startFromOffset>100</startFromOffset>
        <limitResults>50</limitResults>
    </preferences>
</ServiceRequest>
```
Limit your results

Use the optional “fields” parameter for any Search or Get API request to limit the amount of information returned in the results. Simply specify the fields you want to include in the output, and all other information will be filtered out. Multiple fields are comma separated and wildcards are supported.

Example - Get Request

This get request will fetch tag ID 12345 and return the tag ID, name and creation date.

https://qualysapi.qualys.com/qps/rest/2.0/get/am/tag/12345?fields=id,name,created

Example - Search Request

This search request will return the ID of the connector and the ID of any default tags attached to the connector:

https://qualysapi.qualys.com/qps/rest/2.0/search/am/awsassetdataconnector?fields=id,defaultTags.list.SimpleTag.id

Using wildcards, the example above could be represented as:

https://qualysapi.qualys.com/qps/rest/2.0/search/am/awsassetdataconnector?fields=id,defaultTags.*.*.id
Know your Portal Version

Using the Version API you can find out the installed version of Portal and its sub-modules that are available in your subscription.

Tag API

The Tag API provides a suite of API functions for creating and managing tags. Also the related Admin User API lets you list users and their associated tags.

Operations
Get Tag Info
Create Tag
Update Tag
Search Tags
Count Tags
Delete Tag
Evaluate Tag
List Users with their Tags

Reference
Tag Fields
Get Tag Info

Returns a single tag by ID.

**URL**
https://<baseurl>/qps/rest/2.0/get/am/tag/<id>

**Method**
GET

**Limit your results**
Use the optional “fields” parameter to limit the amount of information returned for the tag. [Learn more](#)

Permissions

Managers with Full Scope

Users without Full Scope must have these account permissions:
- Access Permission “API Access”

Example

Fetch tag ID 12345.

**Request:**
```
curl -n -u "USERNAME:PASSWORD" "https://qualysapi.qualys.com/qps/rest/2.0/get/am/tag/12345"
```

**Response:**
```
<?xml version="1.0" encoding="UTF-8"?>

Create Tag

Create a new tag and possibly child tags.

**URL**

https://<baseurl>/qps/rest/2.0/create/am/tag

**Method**

POST

**Permissions**

Managers with Full Scope

Users without Full Scope must have these account permissions:
- Access Permission “API Access”
- Tag Permission “Create User Tag”
- Tag Permission “Modify Dynamic Tag Rules” (to create a dynamic tag)

**Example**

This example creates a new tag and 3 child tags.

**Request**:

curl -u "USERNAME:PASSWORD" -H "Content-type: text/xml" -X "POST" --data-binary @-
"https://qualysapi.qualys.com/qps/rest/2.0/create/am/tag" < file.xml

Update Tag

Update fields for a tag and collections of tags.

**URL**

https://<baseurl>/qps/rest/2.0/update/am/tag/<id>

or

https://<baseurl>/qps/rest/2.0/update/am/tag

**Method**

POST

Using the NOT EQUALS operator for updating tags could result in accidental update of unknown tags without any warning. To prevent accidental updates of unknown tags, we do not support NOT EQUALS operator for update actions.

**Permissions**

Managers with Full Scope

Users without Full Scope must have these account permissions:

- Access Permission “API Access”
- Tag Permission “Edit User Tag”
- Tag Permission “Modify Dynamic Tag Rules” (to update a dynamic tag)

**Example**

**Request:**

This example renames parent tag 12345 and removes some of its child tags.

```
curl -u "USERNAME:PASSWORD" -H "Content-type: text/xml" -X "POST" --data-binary @-
"https://qualysapi.qualys.com/qps/rest/2.0/update/am/tag/12345" < file.xml
```

Note: “file.xml” contains the request POST data.

**Request POST data (file.xml):**

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<ServiceRequest>
  <data>
    <Tag>
      <name>Parent Tag (Updated)</name>
      <children>

Search Tags

Returns a list of tags that match the provided criteria.

**URL**
https://<baseurl>/qps/rest/2.0/search/am/tag

**Method**
POST

**Pagination**
A maximum of 100 tags are returned by default. To customize this specify a “preferences” tag in the POST body of your request.

**Limit your results**
Use the optional “fields” parameter to limit the amount of information returned for each tag. [Learn more](#)

Delete Tag

Delete tags one or more tags.

**URL**

https://<baseurl>/qps/rest/2.0/delete/am/tag/<id>

or

https://<baseurl>/qps/rest/2.0/delete/am/tag

**Method**

POST

Using the NOT EQUALS operator for deleting tags could result in accidental deletion of unknown tags without any warning. To prevent accidental deletion of unknown tags, we do not support NOT EQUALS operator for delete actions.

**Permissions**

Managers with Full Scope

Users without Full Scope must have these account permissions:

- Access Permission “API Access”
- Tag Permission “Delete User Tag”

**Examples**

Delete the tag that has the ID 12345.

**Request:**

curl -u "USERNAME:PASSWORD" -H "content-type: text/xml" -X "POST" --data-binary @- "https://qualysapi.qualys.com/qps/rest/2.0/delete/am/tag/12345"

List Users with their Tags

The Admin User API (/qps/rest/1.0/{action}/admin/user) gives information on users along with their tags to the authorized user. Currently, we support three actions for the users: search, count, and get details of a user.

**URL:**
https://qualysapi.qualys.com/qps/rest/1.0/{action}/admin/user

**Method allowed:**
POST, GET

### Search Users (POST)

You can search for users by using different filters for user ID, username, email, tags, and module names. If no filter is specified, all users in the user's scope are listed.

**XSD:** User.XSD

**API Request:**

```bash
curl -u "USERNAME:PASSWORD" -H "content-type: text/xml" -X "POST"
--data-binary @-
"https://qualysapi.qualys.com/qps/rest/1.0/search/admin/user" < file.xml
```

Note: “file.xml” contains the request POST data.

**Request POST Data (file.xml):**

```xml

Host Asset API

The Host Asset API provides a suite of API functions for managing host assets. In many cases these are hosts detected by our cloud scanners. Host assets can also be added manually by the Qualys API or user interface. The HostAsset members identify operating system, NetBIOS, tags, open ports, NICs, installed software, EC2 source information and current vulnerabilities (all instances).

**Operations**
- Get Host Asset Info
- Create Host Asset
- Update Host Asset
- Search Hosts Assets
- Count Host Assets
- Delete Host Asset
- Activate Host Asset

**Reference**
- Host Asset Fields
Get Host Asset Info

Returns a single host asset by ID. This API returns additional EC2 metadata of Amazon EC2 hosts when inventoried using the Qualys EC2 Connector.

**URL**

https://<baseurl>/qps/rest/2.0/get/am/hostasset/<id>

**Method**

GET

**Limit your results**

Use the optional “fields” parameter to limit the amount of information returned for the host asset. [Learn more](#)

**Permissions**

Managers with Full Scope

Users without Full Scope must have these account settings: 1) scope includes the requested asset, and 2) permissions include:
- Access Permission “API Access”
- Asset Management Permission “Read Asset”

**Example**

**Example 1: Fetch host asset ID and list asset details**

**Request:**

```bash
curl -n -u "USERNAME:PASSWORD"

Create Host Asset

Create one or more host assets using writable fields and collections. It is a good idea to attach tags that will make new assets visible to the current user if that user does not have permission to see all assets. Otherwise users will not be able to see or modify the new assets until an administrator or process attaches the appropriate tags to them.

What’s next? Once you’ve created new host assets you need to activate the assets in order to make them available for scanning and reporting in the Vulnerability Management (VM) module. See Activate Host Asset

Update Host Asset

Update fields for a host asset and collections of host assets.

**URL**

https://<baseurl>/qps/rest/2.0/update/am/hostasset/<id>

or

https://<baseurl>/qps/rest/2.0/update/am/hostasset

**Method**

POST

Using the NOT EQUALS operator for updating host assets could result in accidental update of unknown host assets without any warning. To prevent accidental updates of unknown host assets, we do not support NOT EQUALS operator for update actions.

**Permissions**

Managers with Full Scope

Users without Full Scope must have these account settings: 1) scope includes the requested asset(s), and 2) permissions include:
- Access Permission “API Access”
- Asset Management Permission “Update Asset”

**Example**

**Request 1:**
Update some of the fields for host asset ID 12345.

curl -u "USERNAME:PASSWORD" -H "Content-type: text/xml" -X "POST" 
--data-binary @- "https://qualysapi.qualys.com/qps/rest/2.0/update/am/hostasset/12345" < file.xml

Note: “file.xml” contains the request POST data.

**Request POST data (file.xml):**

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<ServiceRequest>
  <Asset><data>
    <HostAsset>
      <name>Updated Name</name>
      <os>WINDOWS 95</os>

Search Hosts Assets

Returns a list of host assets matching the provided criteria. Assets are returned when they are visible to the user (i.e. in the user’s scope).

**URL**
https://<baseurl>/qps/rest/2.0/search/am/hostasset

**Method**
POST

**Pagination**
A maximum of 100 host assets are returned by default. To customize this specify a “preferences” tag in the POST body of your request.

**Limit your results**
Use the optional “fields” parameter to limit the amount of information returned for each host asset. [Learn more](#)

Managers with Full Scope

Users without Full Scope must have these account settings: 1) scope includes the requested asset(s), and 2) permissions include:
- Access Permission “API Access”
- Asset Management Permission “Delete Asset”

**Example**

Delete host assets with the tag “To Delete”.

**Request:**

curl -u "USERNAME:PASSWORD" -H "content-type: text/xml" -X "POST"
--data-binary @-
"https://qualysapi.qualys.com/qps/rest/2.0/delete/am/hostasset" <
file.xml

Note: “file.xml” contains the request POST data.

**Request POST data (file.xml):**

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<ServiceRequest>
  <filters>
    <Criteria field="tagName" operator="EQUALS">To Delete</Criteria>
  </filters>
</ServiceRequest>
```
Response:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<ServiceResponse xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:noNamespaceSchemaLocation="https://qualysapi.qualys.com/qps/xsd/2.0/am/hostasset.xsd">

    </data>
</ServiceResponse>
```
Activate Host Asset

Activate one or more assets to make them available in your account for scanning and reporting. You’ll want to activate newly created hosts to make them available in the Vulnerability Management (VM) application module and/or the Policy Compliance (PC) module.

**URL for VM assets**

https://<baseurl>/qps/rest/2.0/activate/am/hostasset/<id>?
?module=QWEB_VM

or

https://<baseurl>/qps/rest/2.0/activate/am/hostasset?

Allowed Operators

- Integer: EQUALS, NOT EQUALS, GREATER, LESSER, IN
- Text: CONTAINS, EQUALS, NOT EQUALS
- Date: EQUALS, NOT EQUALS, GREATER, LESSER
- Keyword: EQUALS, NOT EQUALS, IN
- Boolean: (true/false) EQUALS, NOT EQUALS

Permissions

Managers with Full Scope

Users without Full Scope must have these account settings: 1) scope includes the requested asset(s), and 2) permissions include:
- Access Permission “API Access”

For PC assets, the Policy Compliance (PC) module must be enabled

Example

Activate the host assets with the tag “Export to VM”.

Request:
curl -u "USERNAME:PASSWORD" -H "content-type: text/xml" -X "POST"
--data-binary @-
"https://qualysapi.qualys.com/qps/rest/2.0/activate/am/hostasset"

Asset API

The Asset API is a subset of the Host Asset API. The Asset members identify name, tags, and EC2 source information.

**Operations**
- Get Asset Info
- Update Asset
- Search Assets
- Count Assets
- Delete Asset
- Activate Asset

**Reference**
- Asset Fields
Get Asset Info

Returns a single asset by ID.

**URL**

https://<baseurl>/qps/rest/2.0/get/am/asset/<id>

**Method**

GET

**Limit your results**

Use the optional “fields” parameter to limit the amount of information returned for the asset. Learn more

Permissions

Managers with Full Scope

Users without Full Scope must have these account settings: 1) scope includes the requested asset, and 2) permissions include:
- Access Permission “API Access”
- Asset Management Permission “Read Asset”

Example

This example fetches the asset ID 12345 and lists asset details.

**Request:**

curl -n -u "USERNAME:PASSWORD"
"https://qualysapi.qualys.com/qps/rest/2.0/get/am/asset/12345"

**Response:**

```xml

Update Asset

Update fields for an asset and collections of assets. Only the name and tags can be modified.

**URL**

https://<baseurl>/qps/rest/2.0/update/am/asset/<id>

or

https://<baseurl>/qps/rest/2.0/update/am/asset

**Method**

POST

Using the NOT EQUALS operator for updating assets could result in accidental update of unknown assets without any warning. To prevent accidental updates of unknown assets, we do not support NOT EQUALS operator for update actions.

**Permissions**

Managers with Full Scope

Users without Full Scope must have these account settings: 1) scope includes the requested asset(s), and 2) permissions include:
- Access Permission “API Access”
- Asset Management Permission “Update Asset”

**Example**

**Request 1:**
Update tag 12345 and give it another name.

curl -u "USERNAME:PASSWORD" -H "Content-type: text/xml" -X "POST" --data-binary @-
"https://qualysapi.qualys.com/qps/rest/2.0/update/am/asset/12345"

Search Assets

Returns a list of assets matching the provided criteria. Assets are returned when they are visible to the user (i.e. in the user’s scope).

**URL**
https://<baseurl>/qps/rest/2.0/search/am/asset

**Method**
POST

**Pagination**
A maximum of 100 assets are returned by default. To customize this specify a “preferences” tag in the POST body of your request.

**Limit your results**
Use the optional “fields” parameter to limit the amount of information returned for each asset. [Learn more](#)

**Searchable Fields**

These fields can be used to search for assets.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>id (Integer)</td>
<td>type (Keyword: UNKOWN, HOST, SCANNER, WEBAPP, MALWAREDOMAIN)</td>
</tr>
<tr>
<td>name (Text)</td>
<td>tagName (Text)</td>
</tr>
<tr>
<td>created (Date)</td>
<td>tagId (Text)</td>
</tr>
<tr>
<td>updated (Date)</td>
<td>solrQuery (Text, an asset solr query)</td>
</tr>
</tbody>
</table>

**Allowed Operators**

<table>
<thead>
<tr>
<th>Type</th>
<th>Operator</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integer</td>
<td>EQUALS, NOT EQUALS, GREATER, LESSER, IN</td>
</tr>
<tr>

</tr>
<tr>
<td>Date</td>
<td>EQUALS, NOT EQUALS, GREATER, LESSER</td>
</tr>
<tr>
<td>Keyword</td>
<td>EQUALS, NOT EQUALS, IN</td>
</tr>
</tbody>
</table>

For tagName and tagID, parents of the tag will also match. For example if tag A had child tag B and an asset has tag A, then a search for tag B will return assets with tags A and B.

Host Instance Vulnerability API

The Host Instance Vulnerability API provides a suite of API functions for managing vulnerability instances found on host assets. The supported Host Instance Vulnerability operations are get, count and search.

Operations
Get Vulnerability Info
Search Vulnerabilities
Count Vulnerabilities

Reference
Host Instance Vulnerability Fields
Get Vulnerability Info

Returns a single host instance vulnerability data by ID. See Vulnerability Fields

URL
https://<baseurl>/qps/rest/2.0/get/am/hostinstancevuln/<id>

Method
GET

Limit your results
Use the optional “fields” parameter to limit the amount of information returned for the host instance vulnerability. Learn more

Permissions

Managers with Full Scope

Users without Full Scope must have these account settings: 1) scope includes the requested asset, and 2) permissions include:
- Access Permission “API Access”
- Asset Management Permission “Read Asset”

Example

Fetch the host instance vulnerability with the ID 12345.

Request:
curl -n -u "USERNAME:PASSWORD"
"https://qualysapi.qualys.com/qps/rest/2.0/get/am/hostinstancevuln/12345"

AWS Asset Data Connector API

The AWS Asset Data Connector API provides a suite of API functions for managing AWS asset data connectors, used to scan EC2 instances.

**Operations**
- Get AWS Connector Info
- Create AWS Connector
- Support for AWS GovCloud
- Update AWS Connector
- Search AWS Connectors
- Count AWS Connectors
- Delete AWS Connector
- Run Connector

**Reference**
- AWS Connector Fields
Get AWS Connector Info

Returns a single AWS connector by ID.

**URL**
https://<baseurl>/qps/rest/2.0/get/am/awsassetdataconnector/<id>

**Method**
GET

**Limit your results**
Use the optional “fields” parameter to limit the amount of information returned for the AWS connector. Learn more

**Permissions**
Managers with Full Scope

**Example**

Fetch the asset data connector with the ID 12345.

**Request:**
curl -n -u "USERNAME:PASSWORD" 
"https://qualysapi.qualys.com/qps/rest/2.0/get/am/awsassetdataconnector/12345"

**Response:**

```xml
<?xml version="1.0" encoding="UTF-8"?>

Create AWS Connector

Creates an AWS asset data connector.

**URL**

https://<baseurl>/qps/rest/2.0/create/am/awsassetdataconnector

**Method**

POST

**disabled** (boolean) is used to disable an EC2 connector. This parameter can be set for a “create” or “update” request. When set to “true” the connector is disabled and will not run.

- If a single connector is run and it is disabled an error is returned.
- If multiple connectors are run and all are disabled an error is returned.
- If multiple connectors are run and some are disabled, only connectors that are enabled will run.

**Permissions**

Support for AWS GovCloud

\( \text{isGovCloudConfigured} \) (boolean) is used to enable the GovCloud (US) region for an EC2 connector. This parameter can be set for a “create” or “update” request, and is valid only when the GovCloud (US) option is enabled for your subscription.

When isGovCloudConfigure is set to “true”
- The connector is configured to pull instance info from the GovCloud (US) region only.
- The connector can’t be configured with allRegions set to “true”.

API Request:
```bash
curl -u "USERNAME:PASSWORD" -H "Content-type: text/xml" -X "POST" --data-binary @-
"https://qualysapi.qualys.com/qps/rest/2.0/create/awsassetdataconnector" < file.xml

Support for China Region

You can easily scan EC2 instances included in the AWS China region for vulnerabilities and policy compliance using the Qualys Cloud Platform. You can create/update EC2 connectors to pull instance info from the China region, activate discovered instances for the VM, PC or SCA module, and scan them using our EC2 scan workflow.

`isChinaConfigured` (boolean) is used to enable the China region for an EC2 connector using the AWS Asset Data Connector API (awsassetdataconnector). This parameter can be set for a “create” or “update” request, and is valid only when AWS China option is enabled for your subscription.

When `isChinaConfigured` is set to “true”
- The connector is configured to pull instance info from the China region only.
- The connector can’t be configured with `allRegions` set to “true”.

</ServiceResponse>
Run Connector

Request that one or more asset data connectors are run. The connectors may be run immediately, or queued to run when there is capacity. The response will almost always indicate that the connector is pending. Use GET calls to monitor the status of connectors.

### Associations

**AwsEndpointSimpleQList** - A basic wrapper with one field: regionCode. This is the AWS region code, e.g. us-east-1.

**AwsAuthRecordSimple** - The authentication record a connector will use to communicate with AWS. id (long) is the connector ID, and name (string) is a human readable name to identify the connector key.
The AWS Authentication Record API provides a suite of API functions for managing AWS authentication records, used to scan EC2 instances.

**Operations**
- Get AWS Auth Record Info
- Create AWS Auth Record
- Update AWS Auth Record
- Search AWS Auth Records
