## Appendix
- ................................................................. 95
Preface

This user guide is intended for application developers who will use the Qualys Global AssetView (GAV)/CyberSecurity Asset Management (CSAM) API v2. It is recommended to use v2 APIs. For GAV, we are still supporting the v1 APIs. Refer API v1 User Guide to use v1 APIs.

About Qualys

Qualys, Inc. (NASDAQ: QLYS) is a pioneer and leading provider of cloud-based security and compliance solutions. The Qualys Cloud Platform and its integrated apps help businesses simplify security operations and lower the cost of compliance by delivering critical security intelligence on demand and automating the full spectrum of auditing, compliance and protection for IT systems and web applications.

Founded in 1999, Qualys has established strategic partnerships with leading managed service providers and consulting organizations including Accenture, BT, Cognizant Technology Solutions, Deutsche Telekom, Fujitsu, HCL, HP Enterprise, IBM, Infosys, NTT, Optiv, SecureWorks, Tata Communications, Verizon and Wipro. The company is also a founding member of the Cloud Security Alliance (CSA). For more information, please visit www.qualys.com.

Contact Qualys Support

Qualys is committed to providing you with the most thorough support. Through online documentation, telephone help, and direct email support, Qualys ensures that your questions will be answered in the fastest time possible. We support you 7 days a week, 24 hours a day. Access support information at www.qualys.com/support/.
Get Started

Qualys API Framework - Learn the basics about making API requests. The base URL depends on the platform where your Qualys account is located.

Introduction to GAV/CSAM API Paradigm - Get tips on using the Curl command-line tool to make API requests. Every API request must authenticate using a JSON Web Token (JWT) obtained from the Qualys Authentication API.

Qualys API Framework
The Qualys GAV/CSAM API uses the following framework.

Request URL
The URL for making API requests respects the following structure:
https://<baseurl>/<module>/<object>/<object_id>/<operation>
where the components are described below.

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;baseurl&gt;</td>
<td>The Qualys API server URL that you should use for API requests depends on the platform where your account is located. The base URL for Qualys US Platform 1 is: <a href="https://gateway.qg1.apps.qualys.com">https://gateway.qg1.apps.qualys.com</a></td>
</tr>
<tr>
<td>&lt;module&gt;</td>
<td>The API module. For the GAV/CSAM, the module is: “am”.</td>
</tr>
<tr>
<td>&lt;object&gt;</td>
<td>The module specific object.</td>
</tr>
<tr>
<td>&lt;object_id&gt;</td>
<td>(Optional) The module specific object ID, if appropriate.</td>
</tr>
<tr>
<td>&lt;operation&gt;</td>
<td>The request operation, such as count.</td>
</tr>
</tbody>
</table>
Qualys API Gateway URL

The Qualys API URL you should use for API requests depends on the Qualys platform where your account is located.

Click here to identify your Qualys platform and get the API URL

This documentation uses the API gateway URL for Qualys US Platform 1 (https://gateway.qg1.apps.qualys.com) in sample API requests. If you’re on another platform, please replace this URL with the appropriate gateway URL for your account.
Introduction to GAV/CSAM API Paradigm

Authentication

You must authenticate to the Qualys Cloud Platform using Qualys account credentials (user name and password) and get the JSON Web Token (JWT) before you can start using the GAV/CSAM APIs. Use the Qualys Authentication API to get the JWT.

For example,

```
curl -X POST https://gateway.qg1.apps.qualys.com/auth -d
   "username=value1&password=passwordValue&token=true" -H "Content-Type: application/x-www-form-urlencoded"
```

where gateway.qg1.apps.qualys.com is the base URL to the Qualys API server where your account is located.

- **username** and **password** are the credentials of the user account for which you want to fetch GAV/CSAM data
- **token** should be true
- **Content-Type** should be "application/x-www-form-urlencoded"

The Authentication API returns a JSON Web Token (JWT) which you can use for authentication during GAV/CSAM calls. **The token expires in 4 hours.** You must regenerate the token to continue using the GAV/CSAM API.

Using Curl

**Curl** is a multi-platform command-line tool used to transfer data using multiple protocols. This tool is supported on many systems, including Windows, Unix, Linux and Mac. In this document Curl is used in the examples to build Qualys API requests using the HTTP over SSL (https) protocol, which is required.

Want to learn more? Visit [https://curl.haxx.se/](https://curl.haxx.se/)

The following Curl options are used according to different situations:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-X &quot;POST&quot;</td>
<td>The POST method is required for all GAV/CSAM API requests.</td>
</tr>
<tr>
<td>-H &quot;Authorization:</td>
<td>This option is used to provide a custom HTTP request header</td>
</tr>
<tr>
<td>Bearer &lt;token&gt;&quot;</td>
<td>parameter for authentication. Provide the JSON Web Token (JWT)</td>
</tr>
<tr>
<td></td>
<td>received from Qualys authentication API in the following</td>
</tr>
<tr>
<td></td>
<td>format:</td>
</tr>
<tr>
<td></td>
<td>Authorization: Bearer &lt;token&gt;</td>
</tr>
<tr>
<td></td>
<td>For information about Qualys authentication API, see **</td>
</tr>
<tr>
<td></td>
<td>Authentication.**</td>
</tr>
</tbody>
</table>

The sample below shows a typical Curl request using options mentioned above and how they interact with each other.

```
```
Limit your results

Use the optional “fields” parameter for any API request to limit the amount of information returned in the results. Simply specify the fields you want to include or exclude in the output, and all other information will be filtered out (excluded). Multiple fields are comma separated.

Sample limit results

Use this request to get a list of all asset hosts with information for only the operatingSystem and hardware fields:

```bash
```

**Note:**
The response would still include all the fields, but other than the included fields, the value returned for all other fields would be null.

You can include the following fields to limit your results:

```
address, lastLocation, domain
agent, lastLoggedOnUser, subdomain
agentId, netbiosName, whois
assetName, networkInterface, isp
biosAssetTag, openPort, asn
biosDescription, operatingSystem, customAttributes
biosSerialNumber, processor
cloudProvider, provider
container, sensor
cpuCount, service
dnsName, software
hardware, tag
hostId, timeZone
inventory, totalMemory
isContainerHost, userAccount
lastBoot, volume
criticality, businessApps
businessInformation, assignedLocation
```
API Rate Limits

The Qualys API enforces limits on the API calls a customer can make based on their subscription settings. The limits apply to the use of all Qualys APIs except “auth” API (JWT Token Generation API). Default API control settings are provided by the service. Note these settings may be customized per subscription by Qualys Support.

The rate count and period are calculated dynamically each time an API call is received. The rate period represents a rolling window when API calls are counted.

API Controls Definition

X-RateLimit-Remaining: This indicates the total API calls remaining in current rate limit window.

X-RateLimit-ToWait-Sec: This time indicates the wait time for the rate limit to be reset. The customer has to wait for that time to execute next API calls.

X-RateLimit-Window-Sec: This value indicates the total time window assigned for the APIs to be executed.

X-RateLimit-Limit: This indicates the max number of API calls that can be executed in that particular rate limit window.

Sample Request

Note: Provide "-i" in the curl request as shown in the example returns the response headers which includes the rate limit related parameters.

After executing a curl request, check the following parameters in response headers to check the rate-limit status:

X-RateLimit-Remaining: 0
X-RateLimit-ToWait-Sec: 300
X-RateLimit-Window-Sec: 3600
X-RateLimit-Limit: 300

Example: A subscription for Standard API Service has the default API control settings. Consider that the API rate limit set for a customer is 300 API calls for a time window of 3600 seconds. If 300 API calls are received in a 5 minute period and none are blocked by any API limiting rules, then you need to wait 55 minutes before making the next call to the API. During the wait period API calls will be blocked by the rate limiting rule.
Sample HTTP Response Headers

Sample 1: Normal API call (API call not blocked)

Server: nginx/1.19.1
Date: Fri, 16 Apr 2021 12:29:52 GMT
Content-Type: application/json
Transfer-Encoding: chunked
Connection: keep-alive
Vary: Accept-Encoding
X-RateLimit-Remaining: 4
X-RateLimit-Window-Sec: 100
X-RateLimit-Limit: 5
Vary: Accept-Encoding
Cache-Control: no-cache, no-store, max-age=0, must-revalidate
Pragma: no-cache
Expires: 0
X-Content-Type-Options: nosniff
X-Frame-Options: DENY
X-XSS-Protection: 1 ; mode=block
Referrer-Policy: no-referrer

{"count":580,"responseCode":"SUCCESS","responseMessage":"Valid API Access"}

Sample 2: API Call Blocked - Rate Limit exceeded

Server: nginx/1.19.1
Date: Fri, 16 Apr 2021 12:28:53 GMT
Content-Length: 0
Connection: keep-alive
X-RateLimit-Remaining: 0
X-RateLimit-ToWait-Sec: 33
X-RateLimit-Window-Sec: 100
X-RateLimit-Limit: 5
Cache-Control: no-cache, no-store, max-age=0, must-revalidate
Pragma: no-cache
Expires: 0
X-Content-Type-Options: nosniff
X-Frame-Options: DENY
X-XSS-Protection: 1 ; mode=block
Referrer-Policy: no-referrer
User Scoping for APIs

The user will get a response of the assets as per scope using count and list APIs. Typically Manager user has access to more assets than the reader user. So, Reader user won’t be able to get responses for the APIs requested for unauthorized assets.

For example:

If a Manager user has access to 100 assets: the Count API response will show 100 assets and List API will show details of all these 100 assets. Now, consider that the Manager user creates a ‘Reader’ sub user and assigns only 50 assets to this user and when Reader executes APIs, the response will contain data of the only 50 assets and not all 100 assets.
Assets Host Data APIs

Use these API functions to get host data from GAV/CSAM.

**Note:** The software.authorization and lifecycle related parameters are available only for CSAM subscription. Hence, you can use it in filter criteria and you can see it in the response if you’ve subscribed for CSAM.

**Permissions**
- User must have the GAV/CSAM module and the "App API Enabled" option enabled for that role.

**Count of Assets**

Get count of assets satisfying the specified filter criteria.

`rest/2.0/count/am/asset`

[POST]

**Input Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filter</td>
<td>Filter the events list by providing a filter in json and xml format. Make sure your filter criteria is provided in xml/json format in the request body. If you don’t provide filter parameter, it will show details of all the assets. For more information on supported operators, refer Supported Operators.</td>
</tr>
</tbody>
</table>

For example (json) -

```json
{
    "filters": [
        
        
        "field": "software.product",
        "operator": "CONTAINS",
        "value": "Python"
    
    
    
    }
}
```

For example (xml) -

```xml
<FilterRequest>
    <filters>
        <Criteria field="software.product" operator="CONTAINS">Python</Criteria>
    </filters>
</FilterRequest>
```
### Count of Assets

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>assetLastUpdated (String)</td>
<td>Shows records updated on or after this date with the UTC format as yyyy-MM-ddTHH:mmZ e.g. 2019-03-01T11:30Z. This date gets updated whenever any activity happens on the asset. Few examples of such activity: - Vulnerability Management scan - Policy Compliance scan - Inventory collection - Security Configuration Assessment - CertView scan - AssetView or CloudView connector run - Secure Enterprise Mobility scan - Out-of-Band Configuration Assessment - Asset rename - Purge of VM, PC, OCA, CertView records - Agent manifest download - Asset Inventory asset identification updates</td>
</tr>
<tr>
<td>lastSeenAssetId (Integer)</td>
<td>Use to get the count of assets having asset id greater than the specified last seen asset id.</td>
</tr>
<tr>
<td>Authorization (String)</td>
<td>(Required) Authorization token to authenticate to the Qualys Cloud Platform. Prepend token with &quot;Bearer&quot; and one space. For example - Bearer authToken</td>
</tr>
</tbody>
</table>

**Note:** If you want to get a count of assets that fall after the specific asset id, refer to the following example:

**Example:**

https://gateway.qg1.apps.qualys.com/rest/2.0/count/am/asset?lastSeenAssetId=6920718

**Consider the scenario, wherein you have 1000 assets.**
In the API call, if you enter the asset id of the 200th asset in the lastSeenAssetId parameter, the first 200 assets are skipped from the count and the count of the rest of the assets, which is 800 is shown.
Sample - Get count of all assets with filter criteria

**Request:**
```
```

Here, `filter.json` file is the request in json format.

**Sample Request body in json format (filter.json)**
```
{
    "filters": [
    {
        "field": "software.authorization",
        "operator": "EQUALS",
        "value": "Authorized"
    }
    ]
}
```

**Response:**
```
{
    "count": 850,
    "responseCode": "SUCCESS",
    "responseMessage": "Valid API Access"
}
```

Sample - added attribute to "cloudProvider" field

**Request:**
```
curl --location --request POST
'<qualys_base_url>/rest/2.0/count/am/asset' --header 'Authorization: Bearer <JWT Token>' --header 'Content-Type: application/xml' --data-raw
'<!--<FilterRequest> -->
```

**Filter:**
```
<FilterRequest>
<filters>
<Criteria field="alibaba.instance.instanceId"
operator="EQUALS">Instance_MN72C8</value></Criteria>
</filters>
</FilterRequest>
```
Response:
{
"count": 1,
"responseCode": "SUCCESS",
"responseMessage": "Valid API Access"
}

Sample - added "hostingCategory1" information

Request

curl --location --request POST
'<qualys_base_url>/rest/2.0/count/am/asset' --header
'Authorization: Bearer <JWT Token>' --header 'Content-Type: application/xml' --
data
'<FilterRequest>

Filter

<FilterRequest>
<filters>
<Criteria field="asset.hostingCategory1"
operator="EQUALS"><value>Cloud</value></Criteria>
</filters>
</FilterRequest>

Response
{
"count": 77,
"responseCode": "SUCCESS",
"responseMessage": "Valid API Access"
}
# Get Host details of specific asset

Get details of specific asset by providing an asset id.

**rest/2.0/get/am/asset**

[GET]

## Input Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>excludeFields (String)</td>
<td>Comma separated list of fields to be excluded from the asset object in the response. Default is None. You can choose from the list of fields specified in the section &quot;Limit your results&quot;. For example, to exclude openPort and software from the response: excludeFields=openPort,software</td>
</tr>
<tr>
<td>includeFields (String)</td>
<td>Comma separated list of fields to be included in the asset object in the response. Default is All. You can choose from the list of fields specified in the section &quot;Limit your results&quot;. For example, to include only operatingSystem and hardware in the response: includeFields=operatingSystem,hardware</td>
</tr>
<tr>
<td>assetId (Integer)</td>
<td>(Required) Use to specify theAssetId for which you want to retrieve the details.</td>
</tr>
<tr>
<td>softwareType (String)</td>
<td>(Optional) Specify the software type to get the host details for specified software type. Available values for softwareType parameter are Application, Unknown, and Others.</td>
</tr>
<tr>
<td>Authorization (String)</td>
<td>(Required) Authorization token to authenticate to the Qualys Cloud Platform. Prepend token with &quot;Bearer&quot; and one space. For example - Bearer authToken</td>
</tr>
</tbody>
</table>

## Sample - Get host details of specified asset by assetid

**Request:**

```bash
```

**Response:**

```json
{
  "responseMessage": "Valid API Access",
  "responseCode": "SUCCESS",
  "assetListData": {
    "asset": [
      {
        "assetId": 6920718,

Assets Host Data APIs
Get Host details of specific asset

Sample - Get asset details using asset by assetid

Request

curl --location --request GET
'qualys_base_url>/rest/2.0/get/am/asset?assetId=19605572
--header 'Content-Type: application/json' --header 'Authorization: Bearer
<JWT Token' --header 'Content-Type: application/xml' --data-raw
'<FilterRequest>'

Filter in XML

<FilterRequest>
<filters>
<Criteria field="missingSoftware.product"
operator="EQUALS">Windows Defender</Criteria>
</filters>
</FilterRequest>

Filter in json

{ "filters": [ { "field": "missingSoftware.product",
"operator": "EQUALS",
"value": "Windows Defender " } ] }

Response

{ "responseMessage": "Valid API Access",
"count": 1,
"responseCode": "SUCCESS",
"lastSeenAssetId": null,
"hasMore": 0,
"assetListData": { "asset": [ { "processor": null } ] }
}

Sample - added "hostingCategory1" Information

Asset by AssetID

Request:
curl --location --request GET
'<qualys_base_url>/rest/2.0/get/am/asset?assetId=22303276' --
header
'Content-Type: application/json' --header 'Authorization: Bearer
<JWT Token>'

Response
{
  "responseMessage": "Valid API Access",
  "count": 1,
  "responseCode": "SUCCESS",
  "lastSeenAssetId": null,
  "hasMore": 0,
  "assetListData": {
    "asset": [
      {
        "assetId": 22303276,
        "assetUUID": "383c0696-0ac9-42f8-8189-28b7e81f4bb0",
        "hostId": null,
        ...
        "missingSoftware": null,
        "whois": [
          {
            "domain": "blujaysolutions.com",
            "createdDate": "2016-11-30T00:00:00.000Z",
            ...
          }
        ],
        "isp": "Amazon.com, Inc.",
      }
    ]
  }
}
"asn": "AS16509",
"easmTags": [
  "cloud"
],
"hostingCategory1": "ThirdParty",
"customAttributes": null,
"processor": null
}
]

Note: We also support this for includeFields and excludeFields. See the following example.

Example: Asset by asset ID API with includeFields

**Request**

curl --location --request GET
'<qualys_base_url>/rest/2.0/get/am/asset?
assetId=22303276&includeFields=hostingCategory1' --header
'Content-Type: application/json' --header 'Authorization: Bearer <JWT Token>'

**Response**

```json
{
  "responseMessage": "Valid API Access",
  "count": 1,
  "responseCode": "SUCCESS",
  "lastSeenAssetId": null,
  "hasMore": 0,
  "assetListData": {
    "asset": [
      {
        "assetId": 22303276,
        "assetUUID": "383c0696-0ac9-42f8-8189-28b7e81f4bb0",
        "hostId": null,
        ...
        "missingSoftware": null,
        "whois": null,
        "isp": null,
        "asn": null,
        "easmTags": null,
        "hostingCategory1": "ThirdParty",
        "customAttributes": null,
        "processor": null
      }
    ]
  }
}
Assets Host Data APIs
Get Host details of specific asset
Get Host Details of All Assets

Get details of all assets that satisfy the filter criteria to include or exclude specified fields. If you don’t provide filter parameter, it will show details of all the assets.

**rest/2.0/search/am/asset**

**[POST]**

**Input Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>excludeFields (String)</td>
<td>Comma separated list of fields to be excluded from the asset object in the response. Default is None. You can choose from the list of fields specified in the section &quot;Limit your results&quot;. For example, to exclude openPort and software from the response: excludeFields=openPort,software</td>
</tr>
<tr>
<td>includeFields (String)</td>
<td>Comma separated list of fields to be included in the asset object in the response. Default is All. You can choose from the list of fields specified in the section &quot;Limit your results&quot;. For example, to include only operatingSystem and hardware in the response: includeFields=operatingSystem,hardware</td>
</tr>
</tbody>
</table>
| assetLastUpdated (String)| Shows records updated on or after this date with the UTC format as yyyy-MM-ddTHH:mmZ e.g. 2019-03-01T11:30Z  
This date gets updated whenever any activity happens on the asset. Few examples of such activity:  
- Vulnerability Management scan  
- Policy Compliance scan  
- Inventory collection  
- Security Configuration Assessment  
- CertView scan  
- AssetView or CloudView connector run  
- Secure Enterprise Mobility scan  
- Out-of-Band Configuration Assessment  
- Asset rename  
- Purge of VM, PC, OCA, CertView records  
- Agent manifest download  
- Asset Inventory asset identification updates |
lastSeenAssetId (Integer)  Use to get the list of assets having asset id greater than the specified last seen asset id.

**Note:** You can get a list of a maximum of 100 assets in one API call. If you have more than 100 assets, you need to make multiple API calls to get the list of all your assets.

See the following snippet from the Response:

**Response:**

```
{
    "responseMessage": "Valid API Access",
    "count": 1,
    "responseCode": "SUCCESS",
    "lastSeenAssetId": 6920718,
    "hasMore": 1,
}
```

The snippet shows:
- lastSeenAssetId: 6920718
  It indicates the asset id of the last seen asset.
- hasMore: 1
  It indicates that there are more assets.

If you want to get a list of your all assets, refer to the following example:

**Example:**

https://gateway.qg1.apps.qualys.com/rest/2.0/search/am/asset?lastSeenAssetId=6920718

**Consider the scenario, wherein you have 1000 assets.**

In the first API call, you get a list of 100 assets. The asset id of the 100th asset is shown in the lastSeenAssetId parameter. In the 2nd API call, you must enter the asset id of the 100th asset in the lastSeenAssetId parameter to get the list of the next 100 assets. Similarly, in every subsequent API call, you must enter the asset id of the 100th asset in the lastSeenAssetId parameter. Thus, you get the list of your total assets by running 10 API calls.

pageSize (Integer)  The number of records per page to be included in the response. If pageSize is not specified in the request, 100 records will be fetched by default. The maximum value supported for pageSize is 300.
filter (String)  
Filter the events list by providing a filter in json and xml format. Make sure your filter criteria is provided in xml/json format in the request body. If you don’t provide filter parameter, it will show details of all the assets. For more information on supported operators, refer Supported Operators.

For example (json) -
```
{  
    "filters": [  
      {  
        "field": "software.product",  
        "operator": "CONTAINS",  
        "value": "Python"  
      }  
    ]  
}
```

For example (xml) -
```
<FilterRequest>
  <filters>
    <Criteria field="software.product" operator="CONTAINS"><value>Python</value></Criteria>
  </filters>
</FilterRequest>
```

softwareType (String)  
(Optional) Specify the software type to get the host details for specified software type. Available values for softwareType parameter are Application, Unknown, and Others.

Authorization (String)  
(Required) Authorization token to authenticate to the Qualys Cloud Platform. Prepend token with "Bearer" and one space. For example - Bearer authToken

missingSoftware.name (String)  
(Required) Provide the missing software name.

missingSoftware.category1 (String)  
(Required) Provide the missing software category 1.

missingSoftware.category2 (String)  
(Required) Provide the missing software category 2.

missingSoftware.publisher (String)  
(Required) Provide the missing software publisher.

missingSoftware.product (String)  
(Required) Provide the missing software product.
Sample - Get details of all asset

Request (without filter):
```bash
```

Request (with filter - xml):
```bash
```
Here, `filter.xml` file is the request in xml format.

Request (with filter - json):
```bash
```
Here, `filter.json` file is the request in json format.

Sample Request body in xml format (filter.xml)
```xml
<FilterRequest>
  <filters>
    <Criteria field="operatingSystem.category1" operator="EQUALS"><value>Mac</value></Criteria>
  </filters>
</FilterRequest>
```

Sample Request body in json format (filter.json)
```json
{
  "filters": [
    {
      "field": "operatingSystem.category1",
      "operator": "EQUALS",
      "value": "Mac"
    }
  ]
}
```

Response:
```json
{
  "responseMessage": "Valid API Access",
}
"count": 1,
"responseCode": "SUCCESS",

New or Updated APIs: New

With this release, we’ve added support to import asset business metadata and business app metadata using v2 APIs. This support is available for CSAM Paid and Trial subscriptions only. You’ll be able to import maximum 250 records in the single request.

Sample - Import Business App Metadata

These parameters are mandatory in the request body to import business app metadata: businessAppId, name, created, and lastUpdated

Request:

```
```

Request body:

```
{
  "data": [
    {
      "businessAppId": "2fc86c650a0a0bb4003698b5331640df",
      "name": "Banking Service",
      "businessCriticality": "1 - Most Critical",
      "status": "Installed",
      "environment": "Production",
      "usedFor": "Production",
      "created": 1620643264000,
      "lastUpdated": 1620653309000,
      "operationalStatus": "Installed",
      "ownedBy": "Joey Bolick",
      "managedBy": "Byron Fortuna",
      "supportedBy": "John Doe",
      "supportGroup": "IT Operations"
    },
    {
      "businessAppId": "5678f28f933a31003b4bb095e57ff88",
      "name": "Customer Support Portal",
      "businessCriticality": "3 - Low",
      "status": "Installed",
      "environment": "Development",
      "usedFor": "Development"
    }
  ]
}
```
"created": 1620643264000,
"lastUpdated": 1620653309000,
"operationalStatus": "Installed",
"ownedBy": "Joey Bolick",
"managedBy": "Byron Fortuna",
"supportedBy": "John Doe",
"supportGroup": "Application Security"
}]

Response:
{
"requestId": "8e9b3fd5-bb89-4666-a472-4bc5758335a2",
"responseMessage": "Business app metadata imported successfully",
"responseCode": "SUCCESS",
"failedIds": null
}

Note: If the business app data for the associated business app id of the asset is not present then the association of that business app with the asset will not happen but the rest of all the data will get updated.

}
Import Business Information Metadata

Use these API functions to import asset business metadata and business app metadata using v2 APIs. This support is available for CSAM Paid and Trial subscriptions only. You’ll be able to import maximum 250 records in the single request.

Permissions

- User must have the GAV/CSAM module and the "App API Enabled" option enabled for that role.

Note:

1) For updating business information metadata, you need to send new request with desired attributes to be changed along with all the attributes. If you don’t include an attribute in the request, the value of the attribute will be override with NULL value.

2) If you have changed business app metadata then you need to explicitly send a request to change the asset business metadata for those assets.

Import Business App Metadata

Import business app metadata as per input criteria in the request body.

rest/2.0/upsert/am/businessapp/metadata

[POST]

Input Parameters for Business Information Metadata

Import Asset Business Metadata
Check Sync Status of an Active EASM Profile

Using this API, you can check the sync status of the active EASM profile.

**easm/v1/profile/status**

[GET]

**Request:**
```
curl --location --request GET
'https://gateway.qg1.apps.qualys.com/easm/v1/profile/status' \ --
header 'Authorization: Bearer <JWT Token>'
```

**Response:**

**Response if the Discovery sync is In-Progress:**
```
[
   {
      "profileId": 5552,
      "profileSaveTimestamp": "2022-12-15T15:27:18.000+00:00",
      "status": "IN_PROGRESS"
   }
]
```

**Response if the Discovery sync is completed:**
```
[
   {
      "profileId": 3101,
      "profileSaveTimestamp": "2022-08-19T15:28:27.000+00:00",
      "status": "COMPLETED"
   }
]
```
GET List of Vulnerabilities Discovered by EASM

Use these API functions to get host data from GAV/CSAM.

**rest/2.0/search/am/easm/vulns**

[POST]

**Input Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>asset.assetId</td>
<td>(Integer) Provide the asset Id for which you want to get the list of vulnerabilities.</td>
</tr>
<tr>
<td>asset.ipaddress</td>
<td>(String) Provide the IP address of the asset for which you want to get the list of vulnerabilities.</td>
</tr>
<tr>
<td>vulnerability.cveld</td>
<td>(Integer) Provide the cveld of the vulnerability.</td>
</tr>
<tr>
<td>vulnerability.type</td>
<td>(String) Provide the vulnerability type, for example - Potential.</td>
</tr>
<tr>
<td>vulnerability.cvss</td>
<td>(Integer) Provide the cvss score of the vulnerability.</td>
</tr>
<tr>
<td>vulnerability.qvs</td>
<td>(Integer) Provide the qvs score of the vulnerability.</td>
</tr>
</tbody>
</table>

**Sample - Get a list of assets with vulnerabilities with specific CVEID, CVSS, and QVS**

**API Request without filter:**

```bash
curl --location --request POST
'https://gateway.qgl.apps.qualys.com/rest/2.0/search/am/easm/vulns
' \--header 'Authorization: Bearer <JWT Token>' \--data-raw ''
```

**Response**

```json
{
   "responseMessage": "Valid API Access",
   "count": 2,
   "responseObject": "SUCCESS",

API Request with filter in XML format:
Refer to the following example, wherein you can see a sample request to get all assets with vulnerabilities with CVSS greater then 9.
GET List of Vulnerabilities Discovered by EASM

curl --location --request POST 'https://gateway.qgl.apps.qualys.com/rest/2.0/search/am/easm/vulns' \
   --header 'Authorization: Bearer <JWT Token>' \
   --header 'Content-Type: application/xml' \
   --data-raw '<FilterRequest>
   <filters>
   <Criteria field="vulnerability.cvss" operator="GREATER">
   <value>9</value>
   </Criteria>
   </filters>
   </FilterRequest>'

Response
{
   "responseMessage": "Valid API Access",
   "count": 2,
   "responseCode": "SUCCESS",
   "lastSeenVulnId": 17060,
   "hasMore": 0,
   "externalVulnerabilityListData": {
      "vulnerability": [
         {
            "ipaddress": "20.100.300.600",
            "assetId": 19046733,
            "vulnId": 17046,
            "cveId": "CVE-2017-9120",
            "type": "Potential",
            "summary": "PHP 7.x through 7.1.5 allows remote attackers to cause a denial of service (buffer overflow and application crash) or possibly have unspecified other impact via a long string because of an Integer overflow in mysqli_real_escape_string."
         },
         {
            "ipaddress": "20.100.300.600",
            "assetId": 19046733,
            "vulnId": 17060,
            "cveId": "CVE-2021-21708",
            "type": "Potential",
            "summary": "In PHP versions 7.4.x below 7.4.28, 8.0.x below 8.0.16, and 8.1.x below 8.1.3, when using filter"
functions with FILTER_VALIDATE_FLOAT filter and min/max limits, if the filter fails, there is a possibility to trigger use of allocated memory after free, which can result in crashes, and potentially in overwrite of other memory chunks and RCE. This issue affects: code that uses FILTER_VALIDATE_FLOAT with min/max limits.

```
{

GET List of Vulnerabilities Discovered by EASM

Response
{
  "responseMessage": "Valid API Access",
  "count": 2,
  "responseCode": "SUCCESS",
  "lastSeenVulnId": 17068,
  "hasMore": 0,
  "externalVulnerabilityListData": [
    "vulnerability": {
      "ipaddress": "20.100.300.600",
      "assetId": 19046733,
      "vulnId": 17046,
      "cveId": "CVE-2017-9120",
      "type": "Potential",
      "summary": "PHP 7.x through 7.1.5 allows remote attackers to cause a denial of service (buffer overflow and application crash) or possibly have unspecified other impact via a long string because of an integer overflow in mysqli_real_escape_string."
    },
    "lastUpdated": "2022-12-14",
    "qvs": 72,
    "cvss": 9.8
  },
  "vulnerability": {
    "ipaddress": "20.100.300.600",
    "assetId": 19046733,
    "vulnId": 17068,
    "cveId": "CVE-2022-37454",
    "type": "Potential",
    "summary": "The Keccak XKCP SHA-3 reference implementation before fdc6fe6 has an integer overflow and resultant buffer overflow that allows attackers to execute arbitrary code or eliminate expected cryptographic properties. This occurs in the sponge function interface."
    "lastUpdated": "2022-12-14",
    "qvs": 72,
    "cvss": 9.8
  }
}
Note:

- The following operators are supported for 'vulnerability.cvss' and 'vulnerability.qvs':
  EQUALS, IN, NOT_EQUALS, GREATER, LESSER, GREATER_THAN_EQUAL, LESS_THAN_EQUAL
- Page Size for Response will be 1000. The lastSeenVulnId can be used for pagination.

Example:

https://gateway.qgl.apps.qualys.com/rest/2.0/search/am/easm/vulns?lastSeenVulnId=17068

Here, lastSeenVulnID is the VulnID of the last CVE in response where VulnID is a unique identifier created for each CVE. It does not have any other significance.

- Provide multiple values as a comma separated list and also use the IN Operator.

Example:

```json
{
  "filters": [
    {
      "field": "vulnerability.cveId",
      "operator": "IN",
      "value": "CVE-2021-21707,CVE-2021-21708"
    }
  ]
}
```
EASM Profile APIs

Use these APIs to get your existing EASM profile, delete your existing EASM profile, create a new EASM profile, and overwrite the EASM profile.

Important Considerations for EASM Profile APIs

Before working with the EASM Profile APIs, refer to the following:

- Only JSON format is supported for payload (POST, PUT, PATCH); XML is not supported.
- If multiple values are provided for any SEED/Filters, those should be separated by a semi-colon.
- For SEED type DOMAIN, only Top Level Domain should be provided.
- For SEED type NETBLOCK and CERTSUBJECT, enumerateSubsidiary and horizontalEnumeration should always be set to False.
- SEED type CERTSUBJECT is not supported in ExcludeSeeds.
- Country code should be provided for the COUNTRY attribute.

Get an Existing EASM Profile

This API helps you to get your existing EASM profile.

easm/v1/profile/

[GET]

Sample - Get an Existing EASM Profile

API Request:

```bash
curl --location --request GET
'https://gateway.qgl.apps.qualys.com/easm/v1/profile/' \
--header 'Authorization: Bearer <JWT Token>' \
--data-raw ''
```

Response:

```json
{
   "includeSeeds": [
      {
         "seedType": "ORGANIZATION",
         "seedValue": "Qualys, Inc.",
         "seedHeading": null,
         "enumerateSubsidiary": false,
         "horizontalEnumeration": false,
         "seedFilters": []
      }
   ]
}
```
"filterType": "IP",
"filterValue": "2.2.2.2"
},
{
"filterType": "CITY",
"filterValue": "Mumbai"
},
{
"filterType": "COUNTRY",
"filterValue": "GE"
}
],
{
"seedType": "DOMAIN",
"seedValue": "qualys.com",
"seedHeading": null,
"enumerateSubsidiary": true,
"horizontalEnumeration": true,
"seedFilters": [
{
"filterType": "IP",
"filterValue": "2.2.2.2"
},
{
"filterType": "CITY",
"filterValue": "Mumbai"
},
{
"filterType": "COUNTRY",
"filterValue": "AX"
}
]
},
{
"seedType": "CERTSUBJECT",
"seedValue": "abc.ddd.com",
"seedHeading": null,
"enumerateSubsidiary": false,
"horizontalEnumeration": false,
"seedFilters": [
{
"filterType": "IP",
"filterValue": "3.3.3.3"
},
{
"filterType": "CITY",
"filterValue": "Delhi"
}
]
Get an Existing EASM Profile

```json
{
    "filterType": "COUNTRY",
    "filterValue": "AL"
}
,
{
    "seedType": "NETBLOCK",
    "seedValue": "77.194.235.225",
    "seedHeading": null,
    "enumerateSubsidiary": false,
    "horizontalEnumeration": false,
    "seedFilters": [
        {
            "filterType": "IP",
            "filterValue": "4.4.4.4"
        },
        {
            "filterType": "CITY",
            "filterValue": "Jaipur"
        },
        {
            "filterType": "COUNTRY",
            "filterValue": "AD"
        }
    ]
}
],
"excludeSeeds": [
    {
        "seedType": "ORGANIZATION",
        "seedValue": "XYZ"
    },
    {
        "seedType": "NETBLOCK",
        "seedValue": "2.2.1.1"
    },
    {
        "seedType": "CITY",
        "seedValue": "Nashik"
    },
    {
        "seedType": "COUNTRY",
        "seedValue": "IN"
    }
]}
```
Delete an Existing EASM Profile

This API helps you to delete your existing EASM profile.

easm/v1/profile/

[DELETE]

Sample - Delete an Existing EASM Profile

API Request:

curl --location --request DELETE
'https://gateway.qgl.apps.qualys.com/easm/v1/profile/'
--header 'Authorization: Bearer <JWT token>'
--data-raw ''

Response:

200OK
{
  "code": "200",
  "status": "DELETED",
  "date": "2022-10-10T10:03:45.946+00:00",
  "message": "Deleted profile data"
}

Create a New EASM Profile

Using this API, you can create a new EASM profile.

easm/v1/profile/

[POST]

Sample - Create a New EASM Profile

API Request:

curl --location --request POST
'https://gateway.qgl.apps.qualys.com/easm/v1/profile/'
--header 'Authorization: Bearer <JWT Token>'
--header 'Content-Type: application/json' 
--data-raw '"<JSON payload>"

Sample JSON Payload:

{
  "includeSeeds": [
    {
      
```
"seedType": "ORGANIZATION",
"seedValue": "ABC",
"seedHeading": null,
"enumerateSubsidiary": true,
"horizontalEnumeration": true,

"filterType": "IP",
"filterValue": "3.3.3.3"
},
{
"filterType": "CITY",
"filterValue": "Delhi"
}
]
Create a New EASM Profile

```json
{
    "filterType": "COUNTRY",
    "filterValue": "AL"
}
}
{
    "seedType": "CERTSUBJECT",
    "seedValue": "xyz.com",
    "seedHeading": null,
    "enumerateSubsidiary": false,
    "horizontalEnumeration": false,
    "seedFilters": [
        {
            "filterType": "IP",
            "filterValue": "4.4.4.4"
        },
        {
            "filterType": "CITY",
            "filterValue": "Jaipur"
        },
        {
            "filterType": "COUNTRY",
            "filterValue": "DZ"
        }
    ]
},
{
    "seedType": "NETBLOCK",
    "seedValue": "66.194.235.225/24",
    "seedHeading": null,
    "enumerateSubsidiary": false,
    "horizontalEnumeration": false,
    "seedFilters": [
        {
            "filterType": "IP",
            "filterValue": "5.5.5.5"
        },
        {
            "filterType": "CITY",
            "filterValue": "Kolkata"
        },
        {
            "filterType": "COUNTRY",
            "filterValue": "AX"
        }
    ]
}
}
```
"seedType": "NETBLOCK",
"seedValue": "77.194.235.225",
"seedHeading": null,
"enumerateSubsidiary": false,
"horizontalEnumeration": false,
"seedFilters": [
{
    "filterType": "IP",
    "filterValue": "4.4.4.4"
},
{
    "filterType": "CITY",
    "filterValue": "Jaipur"
},
{
    "filterType": "COUNTRY",
    "filterValue": "AD"
}
]
],
"excludeSeeds": [
{
    "seedType": "ORGANIZATION",
    "seedValue": "TSB"
},
{
    "seedType": "NETBLOCK",
    "seedValue": "2.2.1.1"
},
{
    "seedType": "CITY",
    "seedValue": "Nashik"
},
{
    "seedType": "COUNTRY",
    "seedValue": "IN"
}
]
}

Response:
201 Created
{
    "code": "201",
    "status": "SAVED",
    "date": "2022-10-10T10:03:48.929+00:00",
}
Overwrite the EASM Profile

Using this API, you can overwrite the EASM profile.

```
easm/v1/profile/
[PUT]
```

**Note:** It is advised to get the existing profile details using a GET call before updating the profile using PUT; using PUT, we can add SEED and/or filters to the existing profile or delete SEED and/or filters from the existing profile. Please note that the PUT request will overwrite the existing customer profile, so the entire profile configuration must be provided in JSON.

**EASM Existing Profile:**
```
{
    "includeSeeds": [
        {
            "seedType": "ORGANIZATION",
            "seedValue": "Qualys,Inc.",
            "seedHeading": null,
            "enumerateSubsidiary": true,
            "horizontalEnumeration": true,
            "seedFilters": [
                {
                    "filterType": "IP",
                    "filterValue": "2.2.2.2"
                }
            ]
        }
    ],
    "excludeSeeds": []
}
```

**Sample PUT Call - Here Domain is Added, and IP is Removed from the Existing EASM Profile.**

**API Request:**
```
curl --location --request PUT
'https://gateway.p01.eng.sjc01.qualys.com/easm/v1/profile/' \
--header 'Authorization: Bearer <JWT Token>' \
--header 'Content-Type: application/json' \
--data-raw '<JSON payload>'
```

**Sample JSON Payload:**
EASM Profile APIs
Overwrite the EASM Profile

{
  "includeSeeds": [
    {
      "seedType": "ORGANIZATION",
      "seedValue": "Qualys, Inc.",
      "seedHeading": null,
      "enumerateSubsidiary": true,
      "horizontalEnumeration": true,
      "seedFilters": []
    },
    {
      "seedType": "DOMAIN",
      "seedValue": "qualys.com",
      "seedHeading": null,
      "enumerateSubsidiary": false,
      "horizontalEnumeration": false,
      "seedFilters": []
    }
  ],
  "excludeSeeds": []
}

Response:
200 OK
{
  "code": "200",
  "status": "UPDATED",
  "date": "2022-10-10 10:23:45",
  "message": "Profile Updated Successfully"
}

EASM Profile Details After the PUT Request:
{
  "includeSeeds": [
    {
      "seedType": "ORGANIZATION",
      "seedValue": "Qualys, Inc.",
      "seedHeading": null,
      "enumerateSubsidiary": true,
      "horizontalEnumeration": true,
      "seedFilters": []
    },
    {
      "seedType": "DOMAIN",
      "seedValue": "qualys.com",
      "seedHeading": null,
      "enumerateSubsidiary": false,
      "horizontalEnumeration": false,
      "seedFilters": []
    }
  ]
}
Add Seeds/Filters to the Existing EASM Profile

Using this API, you can add Seeds/Filters to the existing EASM profile.

```
easm/v1/profile/

[PATCH]

Note: It is advised to get the existing profile details using a GET call before updating the profile using PATCH; using PATCH, we can add SEED and/or filters to the existing profile but can not delete SEED and/or filters from the existing profile. Using PATCH, we can only provide the SEED/Filters which we want to add to the existing profile; there is no need to provide the entire profile configuration again in JSON.

Existing Profile:
```
{
    "includeSeeds": [
        {
            "seedType": "ORGANIZATION",
            "seedValue": "Qualys,Inc.",
            "seedHeading": null,
            "enumerateSubsidiary": true,
            "horizontalEnumeration": true,
            "seedFilters": [
                {
                    "filterType": "CITY",
                    "filterValue": "Pune"
                },
                {

                {
                    "filterType": "IP",
                    "filterValue": "2.2.2.2"
                }
            ]
        }
    ],
    "excludeSeeds": []
}
```
Sample PATCH Call - Where CITY: Mumbai is Added to IncludeSeeds and IP:1.1.1.1 is Added to ExcludeSeeds for the Existing EASM Profile.

API Request:
curl --location --request PATCH '<qualys_base_url>/easm/v1/profile/' \
--header 'Authorization: Bearer <JWT Token>' \
--header 'Content-Type: application/json' \
--data-raw '<JSON payload>'

Sample JSON Payload:
{
    "includeSeeds": [
    {
        "seedType": "ORGANIZATION",
        "seedValue": "Qualys,Inc.",
        "seedHeading": null,
        "enumerateSubsidiary": true,
        "horizontalEnumeration": true,
        "seedFilters": [
            {
                "filterType": "CITY",
                "filterValue": "Mumbai"
            }
        ]
    },
    "excludeSeeds": [
    {
        "seedType": "NETBLOCK",
        "seedValue": "1.1.1.1"
    }
    ]
}

Response:
200 OK
{
    "code": "200",
    "status": "UPDATED",
    "date": "2022-10-10 10:33:42",
    "message": "Profile Updated Successfully"
}

EASM Profile Details After Patching:
A new field "easmTags" is added to the response of the following APIs. In this field, you can see the EASM tags for an asset discovered through External Attack Surface.

- Asset List V2 API
- Asset by AssetID V2 API
- Asset Count V2 API
Asset List V2 API
rest/2.0/search/am/asset
[POST]

Asset List V2 API (with filter)
Using this API, you can filter the EASM tags for an asset discovered through External Attack Surface.

Request
```
curl --location --request POST
'<qualys_base_url>/rest/2.0/search/am/asset'  
--header 'Authorization: Bearer <JWT Token>'  
--header 'Content-Type: application/xml'  
--data  
'<FilterRequest>'
```

Request Body
```
<filters>
  <Criteria field="easm.tags.name"  
    operator="EQUALS">cloud</value></Criteria>
</filters>
</FilterRequest>
```

Response
```
{
  "responseMessage": "Valid API Access",
  "count": 1,
  "responseCode": "SUCCESS",
  "lastSeenAssetId": 22303132,
  "hasMore": 1,
  "assetListData": {
    "asset": [
    {
      "assetId": 22303132,
      "assetUUID": "c966xxxx-dcb4-xx65-94ce-7xxxe60ca697",
      "hostId": null,
      ...
      "missingSoftware": null,
      "whois": [
      {
        "domain": "totalcloud.io",
        ...
      ]
    }
  }
}
Asset List API (without filter)

Request

```bash
curl --location --request POST
'<qualys_base_url>/rest/2.0/search/am/asset?=null' --header
'Authorization: Bearer <JWT Token>' --header 'Content-Type: application/xml' --data ''
```

Response

```json
{
  "responseMessage": "Valid API Access",
  "count": 1,
  "responseCode": "SUCCESS",
  "lastSeenAssetId": 22303132,
  "hasMore": 1,
  "assetListData": {
    "asset": [
      {
        "assetId": 22303132,
        "assetUUID": "c9xx9134-dcxx-4e65-9xxe-xxx3e60ca697",
        "hostId": null,
        "lastModifiedDate": "2023-03-13T11:11:49.000Z",
        "agentId": null,
        ...
        "missingSoftware": null,
        "whois": [
          {
            "domain": "totalcloud.io",
            "createdDate": "2016-02-01T00:00:00.000Z",
            "dnssec": null,
            ...
```
Asset by AssetID V2 API

rest/2.0/get/am/asset

[GET]

Request:

curl --location --request GET
'<qualys_base_url>/rest/2.0/get/am/asset?assetId=22303132' --header
'Content-Type: application/json' --header 'Authorization: Bearer <JWT Token>'

Response:

{
  "responseMessage": "Valid API Access",
  "count": 1,
  "responseCode": "SUCCESS",
  "lastSeenAssetId": null,
  "hasMore": 0,
  "assetListData": {
    "asset": [
      {
        "assetId": 22303132,
        "assetUUID": "xxx69134-dcxx-4e65-xxce-74f3e60caxxx",
        "hostId": null,
        ...
        "missingSoftware": null,
        "whois": {
          "domain": "totalcloud.io",
          ...
          "registrar": "GoDaddy.com, LLC",
          "organizationName": null,
```
EASM Profile APIs

View "easmTags" Information

"updatedDate": null
]
],
"isp": "Amazon.com, Inc.",
"asn": "AS16509",

        "whois": null,
        "isp": null,
        "asn": null,
        "easmTags": [
          "cloud",
          "cdn"
        ],
      }
    ]
  }
}
Exclude CDN from EASM Profile

By using this API, you can exclude CDNs from the existing EASM profile. Refer to the following request and sample for exclude CDNs from the existing EASM profile API with the POST operator.

Request:

```
curl --location --request POST '<qualys_base_url>/easm/v1/profile/'
--header 'Authorization: Bearer <JWT_token>'
--header 'Content-Type: application/json'
--data '{
    "includeSeeds": [
    {
        "seedType": "DOMAIN",
        "seedValue": "qualys.com",
        "seedHeading": null,
    }
    ]
}

Filter:

<filters>
<Criteria field="easm.tags.name"
operator="EQUALS"><value>cloud</value></Criteria>
</filters>

Response:

```
{
    "count": 173,
    "responseCode": "SUCCESS",
    "responseMessage": "Valid API Access"
}
```

Exclude CDN from EASM Profile

Asset Count V2 API

rest/2.0/count/am/asset

[GET]
Request:

```
curl --location --request POST
'<qualys_base_url>/rest/2.0/count/am/asset' --header 'Authorization: Bearer <JWT Token>' --header 'Content-Type: application/xml'
--data '<FilterRequest>
<filters>
<Criteria field="easm.tags.name"
operator="EQUALS"><value>cloud</value></Criteria>
</filters>
</FilterRequest>
```

Response:

```
{
    "count": 173,
    "responseCode": "SUCCESS",
    "responseMessage": "Valid API Access"
}
```

"status": null,
  "enumerateSubsidiary": false,
  "horizontalEnumeration": false,
  "seedFilters": []
}
,
"excludeSeeds": [
{
    "seedType": "CDN",
    "seedValue": "True"
}
]
]

Response:
{
    "code": "201",
    "status": "SAVED",
    "date": "2023-03-13T09:23:49.174+00:00",
    "message": "Profile Created Successfully: "
}

**Note:** You must provide the CDN value as "True" only. All CDNs are excluded after the next sync is run.
EASM Profile APIs
Exclude CDN from EASM Profile
Import Third-Party Assets API

rest/2.0/am/connector/asset/data/sync

[POST]

With this release, we have introduced this new API that imports Third-Party assets into your CSAM account. This API is introduced only for the Third-Party asset source - Webhook.

**Note:** The Third-Party Asset Identification is a new feature in Beta phase. It’s in early stage and only available on a request basis. Contact your Technical Account Manager (TAM) for more information.

**Before You Begin**
- Create the "businessAppId" using the 2.0/upsert/am/businessapp/metadata API before importing the Third-Party assets.
- The values mentioned in the "identityAttributes" list except "qualysAssetId", "instanceUuid", and "instanceUuidSource" must be the same as mentioned in the "coreAttributes" list.

**Sample - Import Third-Party assets**

**API Request:**

```bash
curl --location --request POST
'<qualys_base_url>/rest/2.0/am/connector/asset/data/sync' \
--header 'Authorization: Bearer <JWT Token>' \
--header 'Content-Type: application/json' \
--data-raw '<JSON payload>'
```

**Sample JSON Payload:**

```json
{
  "connectorMetaData": {
    "requestId": "string",
    "assetCount": "integer",
    "source": "string",
    "connectorUuid": "string"
  },
  "assetData": [
    {
      "identityAttributes": {
        "qualysAssetId": "string",
        "sourceNativeKey": "string",
        "instanceUuid": "String",
        "instanceUuidSource": "String",
        "hostName": "String",
        "netBiosName": "string",
        "fqdn": "String",
        "macAddress": [
```
"string",
"ipAddress": [
  "String"
],

Import Third-Party Assets API
Appendix

This appendix describes the types of error messages returned from GAV/CSAM API requests, list of operators with supported attributes.

Error Messages

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>400</td>
<td>The request could not be understood by the server due to malformed syntax. This error also occurs if you provide wrong (or unsupported) operator in the request.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>This response code is returned for the following scenarios:</td>
</tr>
<tr>
<td></td>
<td>- If the Asset Inventory License is in “Pending Activation”.</td>
</tr>
<tr>
<td></td>
<td>- If “App API Enabled” option is not checked.</td>
</tr>
<tr>
<td></td>
<td>- If “App API Enabled” option is checked, but the license expiration date (for Trial/Full customers) has elapsed.</td>
</tr>
<tr>
<td></td>
<td>- If the customer's license subscription cannot be validated.</td>
</tr>
<tr>
<td>404 Not found</td>
<td>The server has not found anything matching the Request</td>
</tr>
<tr>
<td>416 Requested Range Not Satisfiable</td>
<td>Please provide a Page Size value less than the max page size limit set.</td>
</tr>
<tr>
<td>500 Failure</td>
<td>The server encountered an unexpected condition which prevented it from fulfilling the request</td>
</tr>
</tbody>
</table>

Supported Operators

This section of the appendix lists supported operators for tokens.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMERIC_OPERATORS</td>
<td>EQUALS, IN, NOT_EQUALS, GREATER, LESSER, GREATER_THAN_EQUAL, and LESS_THAN_EQUAL</td>
</tr>
<tr>
<td>NUMERIC_AND_NOT_EQUAL_OPERATORS</td>
<td>EQUALS, IN, GREATER, LESSER, GREATER_THAN_EQUAL, LESS_THAN_EQUAL</td>
</tr>
<tr>
<td>STRING_OPERATORS</td>
<td>CONTAINS, IN, EQUALS, and NOT_EQUALS</td>
</tr>
<tr>
<td>STRING_AND_NOT_EQUAL_OPERATORS</td>
<td>CONTAINS, IN, and EQUALS</td>
</tr>
</tbody>
</table>
## Supported Operators

Following table lists different attributes with supported operators:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Operator</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Asset Attributes</strong></td>
<td></td>
</tr>
<tr>
<td>asset.assetID</td>
<td>NUMERIC_OPERATORS</td>
</tr>
<tr>
<td>asset.name</td>
<td>STRING_OPERATORS</td>
</tr>
<tr>
<td>asset.created</td>
<td>DATE_OPERATORS</td>
</tr>
<tr>
<td>asset.lastUpdated</td>
<td>DATE_OPERATORS</td>
</tr>
<tr>
<td>asset.type</td>
<td>ENUM_OPERATORS</td>
</tr>
<tr>
<td>asset.lastLoggedOnUser</td>
<td>STRING_OPERATORS</td>
</tr>
<tr>
<td>asset.totalMemory</td>
<td>NUMERIC_OPERATORS</td>
</tr>
<tr>
<td>asset.timezone</td>
<td>STRING_OPERATORS</td>
</tr>
<tr>
<td>asset.trackingMethod</td>
<td>ENUM_OPERATORS</td>
</tr>
<tr>
<td>asset.domainRole</td>
<td>ENUM_OPERATORS</td>
</tr>
<tr>
<td>asset.riskScore</td>
<td>ENUM_OPERATORS</td>
</tr>
<tr>
<td>asset.lastBoot</td>
<td>DATE_OPERATORS</td>
</tr>
<tr>
<td>asset.netbiosName</td>
<td>STRING_OPERATORS</td>
</tr>
<tr>
<td>asset.hostId</td>
<td>NUMERIC_OPERATORS</td>
</tr>
<tr>
<td>asset.isContainerHost</td>
<td>BOOLEAN_OPERATORS</td>
</tr>
<tr>
<td>asset.biosAssetTag</td>
<td>STRING_OPERATORS</td>
</tr>
<tr>
<td>asset.biosDescription</td>
<td>STRING_OPERATORS</td>
</tr>
<tr>
<td>asset.biosHardwareUUID</td>
<td>STRING_OPERATORS</td>
</tr>
<tr>
<td>asset.biosSerialNumber</td>
<td>STRING_OPERATORS</td>
</tr>
<tr>
<td>asset.agentID</td>
<td>UUID_OPERATORS</td>
</tr>
<tr>
<td>asset.criticalityScore</td>
<td>NUMERIC_OPERATORS</td>
</tr>

<tr>
<td>customAttributes.connectorId</td>
<td>NUMERIC_OPERATORS</td>
</tr>
</tbody>
</table>

**Note:** The following tokens are available only for CSAM License Subscriber:

- `hardware.lifecycle.stage`, `hardware.lifecycle.eos`, `hardware.lifecycle.ga`, `hardware.lifecycle.intro`, `software.authorization`, `software.license.category`, `software.license.subcategory`, `software.lifecycle.eol`, `software.lifecycle.eos`, `software.lifecycle.ga`, `software.lifecycle.stage`, `software.isPackage`, `software.isPackageComponent`, `operatingSystem.lifecycle.eol`, `operatingSystem.lifecycle.eos`, `operatingSystem.lifecycle.ga`, `operatingSystem.lifecycle.stage`, `customAttributes.key`, `customAttributes.value`, and `customAttributes.connectorId`

**Note:** The External Attack Surface Management (EASM) is now GAed and all CSAM customers will be able to activate this feature from their home page. The following tokens are available after the feature is activated:

- `asset.org.name`, `asset.asn`, `asset.isp`, `asset.domain`, `asset.subdomain`, `whoIs.creationDate`, `whoIs.registrantOrg`, `whoIs.registrantEmailId`, and `whoIs.registrar`
Following are some example to understand the different supported operators by comparing QQL(UI) tokens:

**Example 1 - hardware.category1:Computers**

**Request Body in XML:**
```
<FilterRequest>
  <filters>
    <Criteria field="hardware.category1" operator="CONTAINS">
      <value>Computers</value>
    </Criteria>
  </filters>
</FilterRequest>
```

OR **Request Body in Json:**
```
{
  "filters": [
    {
      "field": "hardware.category1",
      "operator": "CONTAINS",
      "value": "Computers"
    }
  ]
}
```

**Example 2 - hardware.manufacturer:`Apple` OR hardware.manufacturer:`HPE`**

**Request Body in XML:**
```
<FilterRequest>
  <filters>
    <Criteria field="hardware.manufacturer" operator="IN">
      <value>Apple,HPE</value>
    </Criteria>
  </filters>
</FilterRequest>
```

**Example 3 - software:(product:Python and update:2.7.5)**

**Request Body in XML:**
```
<FilterRequest>
  <filters>
    <Criteria field="software.product" operator="CONTAINS">
      <value>Python</value>
    </Criteria>
    <Criteria field="software.update" operator="CONTAINS">
    </Criteria>
  </filters>
</FilterRequest>
```
Example 4 - operatingSystem.category1: `Mac` and hardware.category: Notebook

Request Body in XML:

```xml
<FilterRequest>
  <filters>
    <Criteria field="operatingSystem.category1" operator="EQUALS">
      <value>Mac</value>
    </Criteria>
    <Criteria field="hardware.category" operator="EQUALS">
      <value>Notebook</value>
    </Criteria>
  </filters>
</FilterRequest>
```

Example 5 - operatingSystem.category1: `Mac` or hardware.category: Notebook

Request Body in XML:

```xml
<FilterRequest>
  <filters>
    <Criteria field="operatingSystem.category1" operator="EQUALS">
      <value>Mac</value>
    </Criteria>
    <Criteria field="hardware.category" operator="EQUALS">
      <value>Notebook</value>
    </Criteria>
    <operation>OR</operation>
  </filters>
</FilterRequest>
```

Request Body in Json:

```json
{
  "filters": [
    
  ]
}```
Example 6 - operatingSystem.category1: 'Mac' and hardware.category: 'Notebook'

Request Body in XML:

```xml
<FilterRequest>
  <filters>
    <Criteria field="operatingSystem.category1" operator="EQUALS">
      <value>Mac</value>
    </Criteria>
    <Criteria field="hardware.category" operator="EQUALS">
      <value>Notebook</value>
    </Criteria>
  </filters>
  <operation>OR</operation>
</FilterRequest>
```
