

Qualys Cloud Platform (VM, PC) 10.x

Release Notes

Version 10.23.2

September 05, 2023

This new release of the Qualys Cloud Platform (VM, PC) includes improvements to Vulnerability Management and Policy Compliance.

Issues Addressed

The following issues are fixed with this release:

- For AGMS-enabled subscriptions, the **Account Info > VM Summary** section showed an incorrect number of IPs for the **IP Limit** parameter, specifically when a few IPs were allocated to a business unit. The issue is now fixed and the **IP limit** parameter now shows the correct number of IPs.

Note:

The IP Limit parameter shows the remaining number of IPs after adding IPs to the subscription and reserving IPs for a business unit.

$$\text{IP limit} = \text{IPs purchased} - (\text{IPs in subscription} + \text{IPs allocated to business units})$$

- We have fixed an issue where the Windows Record API encountered an error while retrieving the list of Windows authentication records.
- We have fixed an issue where users were unable to create a new Unix authentication record with an SSH key.
- We have fixed an issue where assets were not appearing in posture which has a PC policy applied and shows compliance information under asset view.
- In subscriptions enabled with New Credential Security Model (NCSM), sub-users without permissions to create or edit authentication records were unable to run authenticated scans. This issue is now fixed.
