

# Qualys Cloud Platform v3.x

## Release Notes

Version 3.15.2

May 15, 2023

## Issues Addressed

### CA Cloud Agent

- The asset data count inconsistency issue in the CAUI application is now fixed. The count of agents displayed on the agent's tab with or without using the QQL query will be equal to the count displayed on the top right corner of the tab.

### CV Cloud View

- We have fixed an issue where the EC2 connector incorrectly marked the EC2 instance as Terminated.

### VMDR Vulnerability Management, Detection, and Response

- We have fixed a syntax error in the QQL token generated after using the Group By field for Detection Age and Detection Score in the Table widget.

### WAS Web Application Scanning

- Previously, users could not add brief scope information due to the lower character limit in the Scope field of the Oauth2 Record. With this release, the Scope field's character limit has been increased to accommodate brief scope information.
- We have fixed an issue where the Find API call displayed an error because the tags contained special characters in the WAS application.
