Qualys Cloud Platform 3.8.1 brings you many more improvements and updates! [Learn more](#)

Create Zero-Touch Patch Job

The Zero-Touch Patch Job option allows you to create an automated job to proactively patch current and future Windows vulnerabilities based on the criteria selected while generating the Prioritization report. Save a lot of time and effort by setting a recurring schedule for the Zero-Touch patch job, and you don't need to worry about remediating the future vulnerabilities for real-time threats. For more information, see VMDR Prioritization Report.

Note: The Zero-Touch Patch option is enabled only for patches available at Qualys and if you have the Patch Management app enabled in your subscription.

Currently, the Zero-Touch Patch option only allows you to create a Windows Patch job. Simply select the Zero-Touch Patch Job option from the Patch Now menu to create a job.

The screenshot displays the VMDR Prioritization interface. At the top, it shows 'Asset Tags (15)' with a list of tags and a search bar. Key statistics include '4 Total Assets' and '441 Total Vulnerabilities'. A 'CVSS Range' chart shows the distribution of vulnerabilities across severity levels: Critical (86), High (229), Medium (154), Low (12), and None (0). The dashboard is divided into several sections: 'Age' with a bar chart showing vulnerability counts over time; 'Real-Time Threat Indicators (RTI)' with categories like 'Potential Impact' and 'Active Threats'; 'Attack Surface' with various system components and their status; and three summary cards: 'Prioritized Assets' (4 of 4, 100% error), 'Prioritized Vulnerabilities' (331 instances, 75.06% error, 324 Unique), and 'Available Patches' (123). A 'Patch Now' dropdown menu is open, highlighting the 'Zero-Touch Patch Job' option.

When you click the Zero-Touch Patch job option, a new Create Windows Deployment Job page will open in the Patch Management App.

New Tokens for VMDR

We have introduced the following new search tokens to enhance your search results:

- **lastVmScanDateScanner:** This token helps you find the date when vulnerability scans were last conducted on the scanner.
- **lastVmScanDateAgent:** This token helps you find the date when vulnerability scans were last conducted on the agent.
- **lastPCScanDateScanner:** This token helps you find the date when policy compliance scans were last conducted on the scanner.
- **lastPCScanDateAgent:** This token helps you find the date when compliance scans were last conducted on the agent.

New Tokens for AssetView

We have introduced the following new search tokens to enhance your search results:

- **oci.compute.state**: This token helps you search all assets with a specific state.
- **oci.compute.tenantId**: This token helps you search all assets with a specific tenant ID.
- **oci.compute.tenantName**: This token helps you search all assets with a specific tenant name.
- **oci.tags.type**: This token helps you search all assets with a specific tag type.

Issues Addressed

CA

Cloud Agent

- We fixed an issue where the 'agentactkey.xsd' schema was missing.
- We fixed an issue where the bulk activation of the VM module on the cloud agents was not working.
