

Qualys CloudView v1.x

Version 1.16.1

June 18, 2021

Here's what's new in Qualys CloudView 1.16.1!

Issues Addressed

AWS

- Updated control logic for CID 59 ,60 ,61 and 62 ; Added additional check for account level public access. If the public access is blocked at account level, we pass control for all buckets irrespective of any setting on bucket level else control will check for all bucket level public access individually.
- Updated control logic for CID 161/170;
161: No Network ACLs allow ingress from 0.0.0.0/0 to port 22
170: No Network ACLs allow ingress from 0.0.0.0/0 to port 3389
- We have now updated the restrictions for random alphanumeric number in the external ID format to give better flexibility.

External ID format: <Qualys POD>--<Qualys Subscription ID>--<random alphanumeric number>

You can now use a combination of alphabets (a-z, A-Z) and numbers without spaces to generate the random alphanumeric unique number. You could use minimum 2 or maximum 1024 digits. The special characters supported are: = , . @ : /

Common

- Auto-run for specific connectors failed due to some technical glitch. We have now fixed the glitch so that auto-run for connectors functions smoothly.

API Enhancements

You can enable remediation for connectors through API as well. For details, refer to the [CloudView 1.16.1 API Release Notes](#).
