Qualys Connector 1.5.0 brings you improvements and updates! [Learn More!](#)

Connector Features

Enhancements to the Connector Listing Page

The Connector listing page in the Connector application is improved with additional functionalities for existing columns. We have made the Assets/Resources column clickable.

- The Assets column redirects you to the CSAM/GAV app with your connector Assets listed. The list shows assets upto 30 days before.
- The Resources column redirects you to the CloudView Resources tab with your account's resources listed.

Note: The asset column update is only applicable to AWS and Azure CloudType as GCP CloudType only displays resources.

Common Features

Introducing Support for Snapshot Based Assessment for AWS

Qualys is introducing a new agentless approach to vulnerability management to utilize Snapshot images of your instances for performing vulnerability assessments. The Snapshot assessment ensures your running workloads are not slowed down by scans over large volumes of data. Additionally, you can add multiple AWS accounts for snapshot scan, allowing to perform large volumes of vulnerability scans together.

Snapshot Based Assessment is available in both Connector Application and TotalCloud Application.

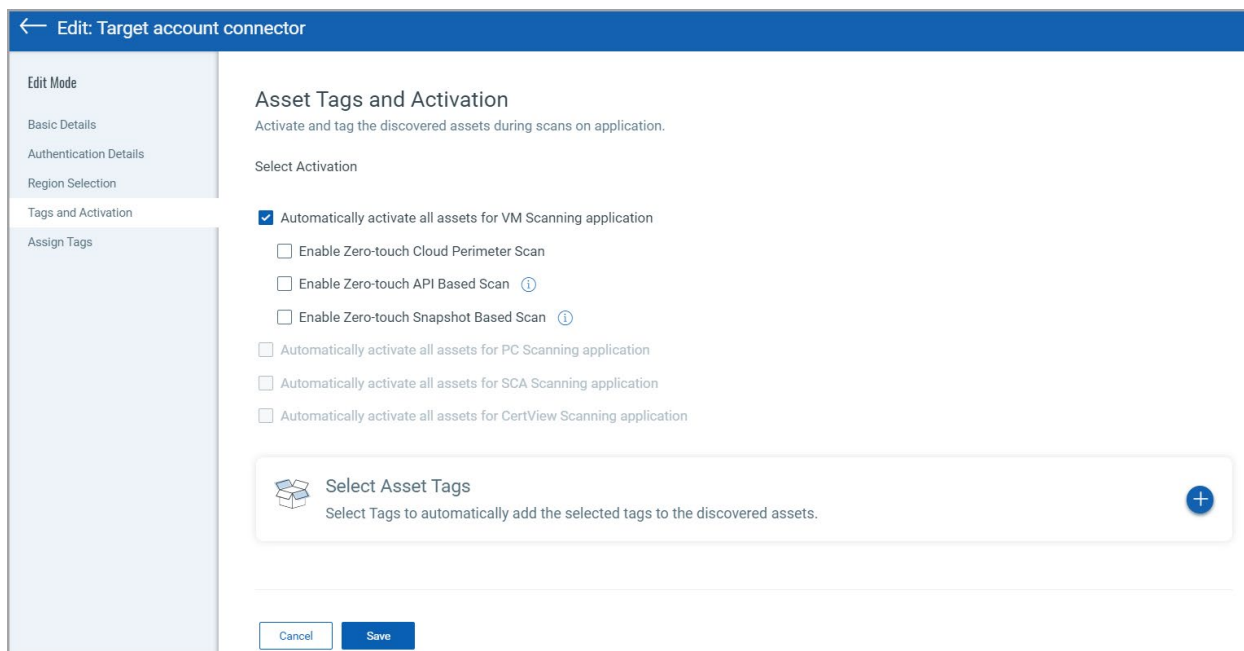

Enable Snapshot Based Assessment for AWS

You will need two AWS accounts to avail Snapshot Based scan functionality. One is your registered service account and the other is your target account.

The pre-requisites for enabling Snapshot-based scans for Connectors can be found in the [Connector online help](#).

The pre-requisites for enabling Snapshot-based scans for Connectors can be found in the [TotalCloud online help](#).

- 1) To enable Snapshot scans in Connector Application, start by configuring an AWS connector in the target account.
- 2) Proceed with the connector creation steps until you reach **Tags and Activation**.
- 3) Select the **Automatically activate all assets for VM Scanning application** checkbox.
- 4) Select **Enable Zero-touch Snapshot Based Scan** (you will need to register a service account to be able check the box. [Learn more](#)).

New Tokens

We have introduced the following new tokens for Connectors and TotalCloud to search for connectors with specified scan types.

scanType.isCPSEnabled: Use values true/false to find Connectors with Cloud Perimeter Scan type enabled.

scanType.isInstantAssessmentEnabled: Use values true/false to find Connectors with API-Based Scan type enabled.

scanType.isSnapshotScanEnabled: Use values true/false to find Connectors with Snapshot-Based scan type enabled.

New Cloud Perimeter Scan Period

We have introduced a new period for launching Cloud Perimeter Scans. Now, you can run one Perimeter scan for your assets every four hours. This update applies to both on-demand and schedule scans.

Issues Fixed in This Release

- We fixed an issue where the GCP Organization connectors were failing to create member connectors
- We fixed an issue where GCP member connectors were automatically going to disabled state on org connector run as while fetching projects for selected folders from gcp
- We fixed an issue where the org connector was unable to create member connectors due to duplication of data in the backend
- We fixed an issue where customer was unable to edit Organization connectors of multiple cloud providers.
- We fixed an issue where GCP Org level connectors showed timeout error when trying to view folder listing.
- We have temporarily disabled the account reconciliation of deleted assets to stop false termination of asset which triggers the purge rule. This may lead to miscount of total running

assets. Customers must now manually purge assets in CSAM as a temporary solution until a permanent fix is deployed.

-We fixed an issue where running EC2 connectors changed the operating system of an asset in AssetView. The fix will be available as part of Portal 3.15.1.0 release.
