

# Qualys Container Security

## Release Notes

Version 1.12.1

November 2, 2021

Here's what's new in Container Security 1.12.1!

[Update to Delete Workflows](#)

[Update to MacOS Installation Instructions for Sensor](#)

Container Security 1.12.1 brings you more improvements and updates! [Learn more](#)

## Update to Delete Workflows

We made a few small UI improvements related to Delete workflows.

- You'll now see the **Delete** option in the Quick Actions menu for the Containers data list. Previously the **Delete** option was only available from the **Actions** menu above the list.
- The Confirmation page that appears when you delete objects from the UI, such as images, containers, reports, etc. has a new look to make these pages consistent with other Qualys products.

## Update to MacOS Installation Instructions for Sensor

We updated the installation instructions that appear in the UI for installing sensors on MacOS. To see the installation instructions, go to **Configurations > Sensors > Download Sensor** and choose **MacOS**. You'll see updated commands on the Installation Instructions page for both Docker Hub and Binary Tar.

Summary of changes:

- added "sudo" permission to commands
- removed touch and chmod commands for "hostid" folder (sensor automatically creates hostid)

## Issues Addressed

- We fixed an issue related to searching containers when the search value includes an underscore ("\_") character. Now you'll get expected results when an underscore is used.
- When any GET API request returns a response that is too long, the response will now include response code 400 and the message "Please try with lower page size."
