

Qualys Container Security

Release Notes

Version 1.25

May 03, 2023

What's New?

Static Scanning of Container Images on CRI-O Runtime

With this release, you can now perform static scanning of container images on the CRI-O runtime. Previously, static scans were supported only on Docker and Containerd runtimes.

Issues Addressed

The following issues have been fixed with this release:

- In a specific scenario in the Kubernetes environment, image-scanning pods kept running for a long time, which unnecessarily consumed the resources in the environment. Now, we have implemented a feature that automatically deletes running pods after a certain period of time has elapsed.
- Old images listed using APIs showed updated data in the **vulnerabilities.result** field, whereas the **lastVmScanDate** field remained unchanged. This issue has been resolved by discontinuing the indexing of **vulnerabilities.result**.
